

# The ECFA 2021 Roadmap for Detector Development

DESY Particle and Astroparticle Physics Colloquium

February 22, 2022

Felix Sefkow  
DESY

# Outline

## Menu

- **Introduction: how and why it started**
- **The process: engaging with the community**
- **The Roadmap: how to read it**
- **Implementation: next steps**

Selection of examples  
with maximal personal bias

Stolen slides from many people -

# Horizon 2020 - Proposal for AIDA-2020 Follow-up

## An Opportunity

### From the EC Call:

- Scope: **Funding** will be provided to research infrastructure networks to kick-start the **implementation of a common strategy/roadmap for technological developments** required for improving their services through partnership with industry.
- Proposals should address:
  - **if not already done**, the identification of key techniques and trends which are crucial for future construction and upgrade of the involved Research Infrastructures and **the definition of roadmaps and/or strategic agendas for their development,**

**Started discussions with ECFA...**

# Horizon 2020 - Proposal for AIDA-2020 Follow-up

## An Opportunity

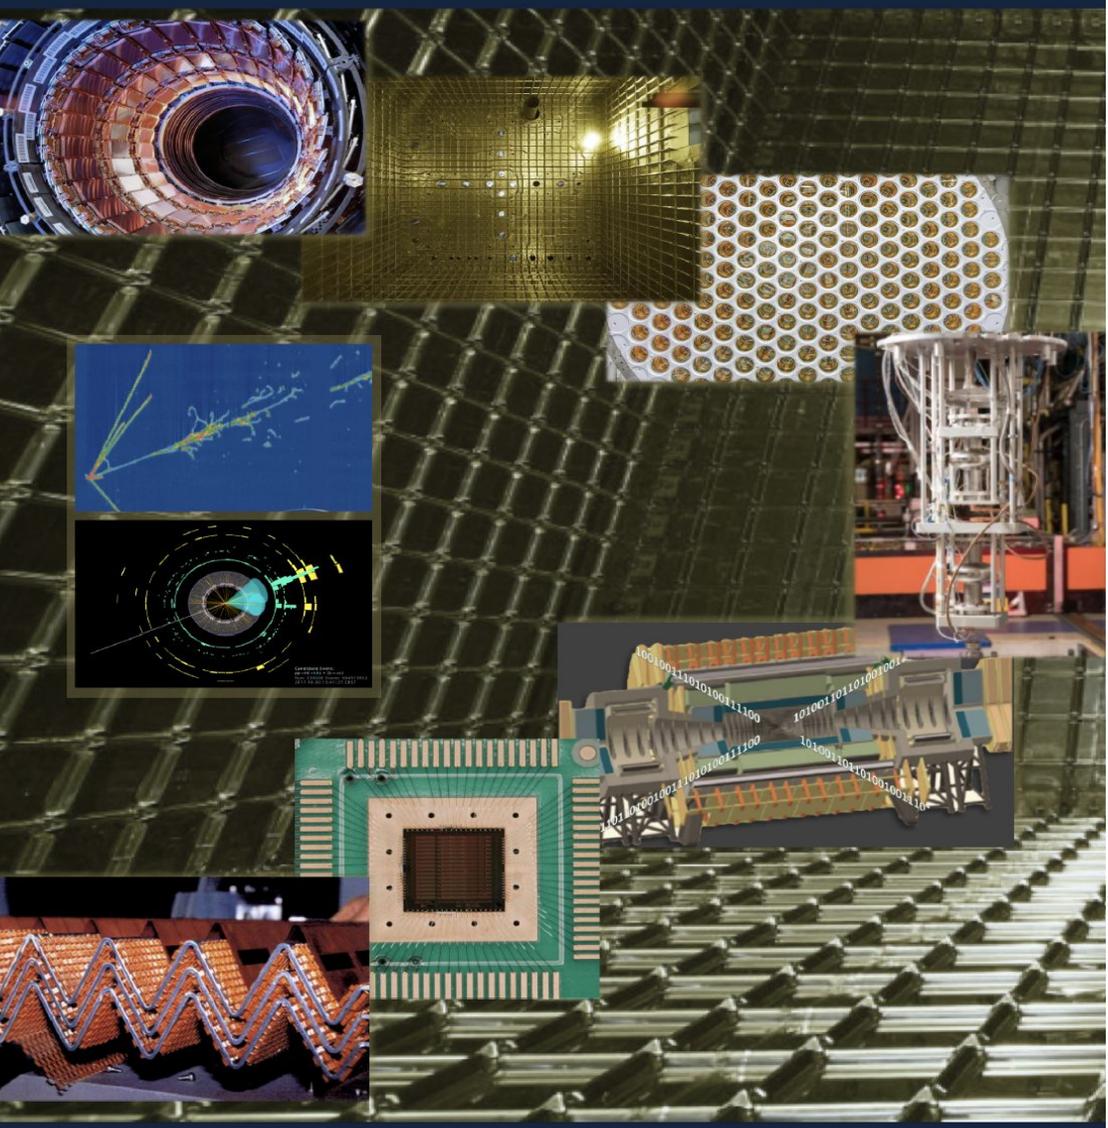

### From the EC Call:

- Scope: **Funding** will be provided to research infrastructure networks to kick-start the **implementation of a common strategy/roadmap for technological developments** required for improving their services through partnership with industry.
- Proposals should address:
  - **if not already done**, the identification of key techniques and trends which are crucial for future construction and upgrade of the involved Research Infrastructures and **the definition of roadmaps and/or strategic agendas for their development**,

### Started discussions with ECFA...

### From the proposal:

- **A roadmap for European Detector R&D is part of the overall long-range planning** of European high-energy physics facilities and its associated technologies and infrastructures.
- The **Update of the European Strategy for Particle Physics (ESPP)**, to be published in summer 2020, **will be followed by a process** towards establishing the corresponding European roadmap for detector R&D.
- This process, initiated **under the responsibility of the European Committee for Future Accelerators (ECFA)**, will cover a broad consultation (...)
- It has been **agreed that ECFA and AIDAInnova will work closely together** in setting up this process, in organising inclusive community meetings and in establishing the roadmap.

# DOE Basic Research Needs Study on Instrumentation

(Report to HEPAP - final draft)

Final Meeting: December 2019

Bonnie Fleming  
Ian Shipsey  
(on behalf of the BRN Panel)

2 European Contributors: P.Krizan, FS

# European Strategy

## Detectors for What?

### European Strategy for Particle Physics Update 2020

- clear directions (often underestimated)

#### Consensus:

- an e+e- Higgs factory is the preferred next collider

#### No consensus:

- linear or circular collider: ILC, CLIC, FCCee,...

#### In addition: long timelines

- different for different projects
- important tasks to be accomplished before

#### Not trivial to motivate a strategic detector development

- ESPPU requested a Detector Roadmap (organised by ECFA)
- Accelerator Roadmap in parallel, by Lab Directors Group

# European Particle Physics Strategy Update

**Main report:** *“Recent initiatives with a view towards strategic R&D on detectors are being taken by CERN’s EP department and by the ECFA detector R&D panel, supported by EU-funded programmes such as AIDA and ATTRACT. Coordination of R&D activities is critical to maximise the scientific outcomes of these activities and to make the most efficient use of resources; as such, there is a clear need to strengthen existing R&D collaborative structures, and to create new ones, to address future experimental challenges of the field beyond the HL-LHC. Organised by ECFA, a roadmap should be developed by the community to balance the detector R&D efforts in Europe, taking into account progress with emerging technologies in adjacent fields.”*

**Deliberation document:** *“Detector R&D programmes and associated infrastructures should be supported at CERN, national institutes, laboratories and universities. Synergies between the needs of different scientific fields and industry should be identified and exploited to boost efficiency in the development process and increase opportunities for more technology transfer benefiting society at large. Collaborative platforms and consortia must be adequately supported to provide coherence in these R&D activities. The community should define a global detector R&D roadmap that should be used to support proposals at the European and national levels.”*

*Task Force convenors, Task Force expert members and Panel members of the ECFA Detector R&D Roadmap Process Group*

**Task Force 1 Gaseous Detectors:** Anna Colaleo<sup>1</sup>, Leszek Ropelewski<sup>2</sup> (*Convenors*)  
Klaus Dehmelt<sup>3</sup>, Barbara Liberti<sup>4</sup>, Maxim Titov<sup>5</sup>, Joao Veloso<sup>6</sup> (*Expert Members*)

**Task Force 2 Liquid Detectors:** Roxanne Guenette<sup>7</sup>, Jocelyn Monroe<sup>8</sup> (*Convenors*)  
Auke-Pieter Colijn<sup>9,10</sup>, Antonio Creditato<sup>11,12,28</sup>, Inés Gil Botella<sup>13</sup>,  
Manfred Lindner<sup>14</sup> (*Expert Members*)

**Task Force 3 Solid State Detectors:** Nicolo Cartiglia<sup>15</sup>, Giulio Pellegrini<sup>16</sup> (*Convenors*)  
Daniela Bortoletto<sup>17</sup>, Didier Contardo<sup>18</sup>, Ingrid-Maria Gregor<sup>19,20</sup>, Gregor Kramberger<sup>21</sup>,  
Heinz Pernegger<sup>22</sup> (*Expert Members*)

**Task Force 4 Particle Identification and Photon Detectors:** Neville Harnew<sup>17</sup>,  
Peter Krizan<sup>21</sup> (*Convenors*)  
Ichiro Adachi<sup>22</sup>, Eugenio Nappi<sup>1</sup>, Christian Joram<sup>2</sup>,  
Hans-Christian Schultz-Coulon<sup>23</sup> (*Expert Members*)

**Task Force 5 Quantum and Emerging Technologies:** Marcel Demarteau<sup>24</sup>,  
Michael Doser<sup>2</sup> (*Convenors*)  
Caterina Braggio<sup>25</sup>, Andy Geraci<sup>26</sup>, Peter Graham<sup>27</sup>, Anna Grasselino<sup>28</sup>,  
John March Russell<sup>17</sup>, Stafford Withington<sup>29</sup> (*Expert Members*)

**Task Force 6 Calorimetry:** Roberto Ferrari<sup>30</sup>, Roman Pöschl<sup>31</sup> (*Convenors*)  
Martin Aleksa<sup>2</sup>, Dave Barney<sup>2</sup>, Frank Simon<sup>32</sup>,  
Tommaso Tabarelli de Fatis<sup>33</sup> (*Expert Members*)

**Task Force 7 Electronics:** Dave Newbold<sup>34</sup>, Francis Vasoy<sup>2</sup> (*Convenors*)  
Niko Neufeld<sup>2</sup>, Valerio Re<sup>30</sup>, Christophe de la Taille<sup>35</sup>, Marc Weber<sup>36</sup> (*Expert Members*)

**Task Force 8 Integration:** Frank Hartmann<sup>36</sup>, Werner Riegler<sup>2</sup> (*Convenors*)  
Corrado Gargiulo<sup>2</sup>, Filippo Resnati<sup>2</sup>, Herman Ten Kate<sup>37</sup>, Bart Verlaet<sup>2</sup>,  
Marcel Vos<sup>38</sup> (*Expert Members*)

**Task Force 9 Training:** Johann Collot<sup>39</sup>, Erika Garutti<sup>40</sup> (*Convenors*)  
Richard Brenner<sup>41</sup>, Niels van Bakel<sup>9</sup>, Claire Gwenlan<sup>17</sup>, Jeff Wiener<sup>2</sup>, Robert Appleby<sup>42</sup>  
(*Expert Members*)

*The Task Force Convenors join those listed below to compose the Detector R&D Roadmap Panel.*

**Panel coordinators:** Phil Allport<sup>42</sup> (*Chair*), Silvia Dalla Torre<sup>43</sup>, Manfred Krammer<sup>2</sup>,  
Felix Sefkow<sup>18</sup>, Ian Shipsey<sup>16</sup>

**Ex-officio Panel members:** Karl Jakobs<sup>44</sup> (*Current ECFA Chair*),  
Jorgen D'Hondt<sup>45</sup> (*Previous ECFA Chair*), Lenny Rivkin<sup>46</sup> (*LDG Representative*)

- **European Strategy Update gives guidance and priorities for future particle physics projects - what we want to do**
- **Coordination of Detector R&D is necessary to maximise the scientific outcome of these activities - how we get there**
- **The roadmap process involves wide community consultation in order to capitalise on best available expertise - but since it is based on the EPPSU, it cannot be fully bottom-up**
- **The roadmap is not resource-loaded, but the common aspirations should establish coherence of funding requests and so unfold its momentum**

# Collecting Requirements

### Input session of Future Facilities I

Friday 19 Feb 2021, 13:00 — 18:00 Europe/Berlin

13:00	13:00	Detector R&D requirements for HL-LHC	Speaker: Chris Parkes (University of Manchester, UK)
13:20	13:20	Detector R&D requirements for strong interaction experiments at future colliders	Speaker: Luciano Musa (CERN)
13:40	13:40	Detector R&D requirements for strong interaction experiments at future fixed target facilities	Speaker: Johannes Bernhard (CERN)
14:00	14:00	Coffee/Tea Break	
14:15	14:15	Detector R&D requirements for future linear high energy e+e- machines	Speaker: Frank Simon (University of Frankfurt, Germany)
14:35	14:35	Detector R&D requirements for future circular high energy e+e- machines	Speaker: Mogens Dam (University of Copenhagen, Denmark)
14:55	14:55	Detector R&D requirements for future high energy hadron colliders	Speaker: Martin Aleksa (CERN)
15:15	15:15	Detector R&D requirements for muon colliders	Speaker: Nadia Pastrone (University of Turin, Italy)

### Input session of Future Facilities II

Monday 22 Feb 2021, 14:00 — 18:00 Europe/Berlin

14:00	14:00	Detector R&D requirements for future short and long baseline neutrino experiments	Speaker: Marzio Nessi (CERN)
14:20	14:20	Detector R&D requirements for future astro-particle neutrino experiments	Speaker: Maarten De Jong (University of Groningen, The Netherlands)
14:40	14:40	Detector R&D requirements for future dark matter experiments	Speaker: Laura Baudis (University of Zurich)
15:00	15:00	Coffee/Tea Break	
15:15	15:15	Detector R&D requirements for future rare decay processes experiments	Speaker: Cristina Lazzeroni (University of Birmingham, UK)
15:35	15:35	Detector R&D requirements for future low energy experiments	Speaker: Dr Alexandre Obertelli (CERN)

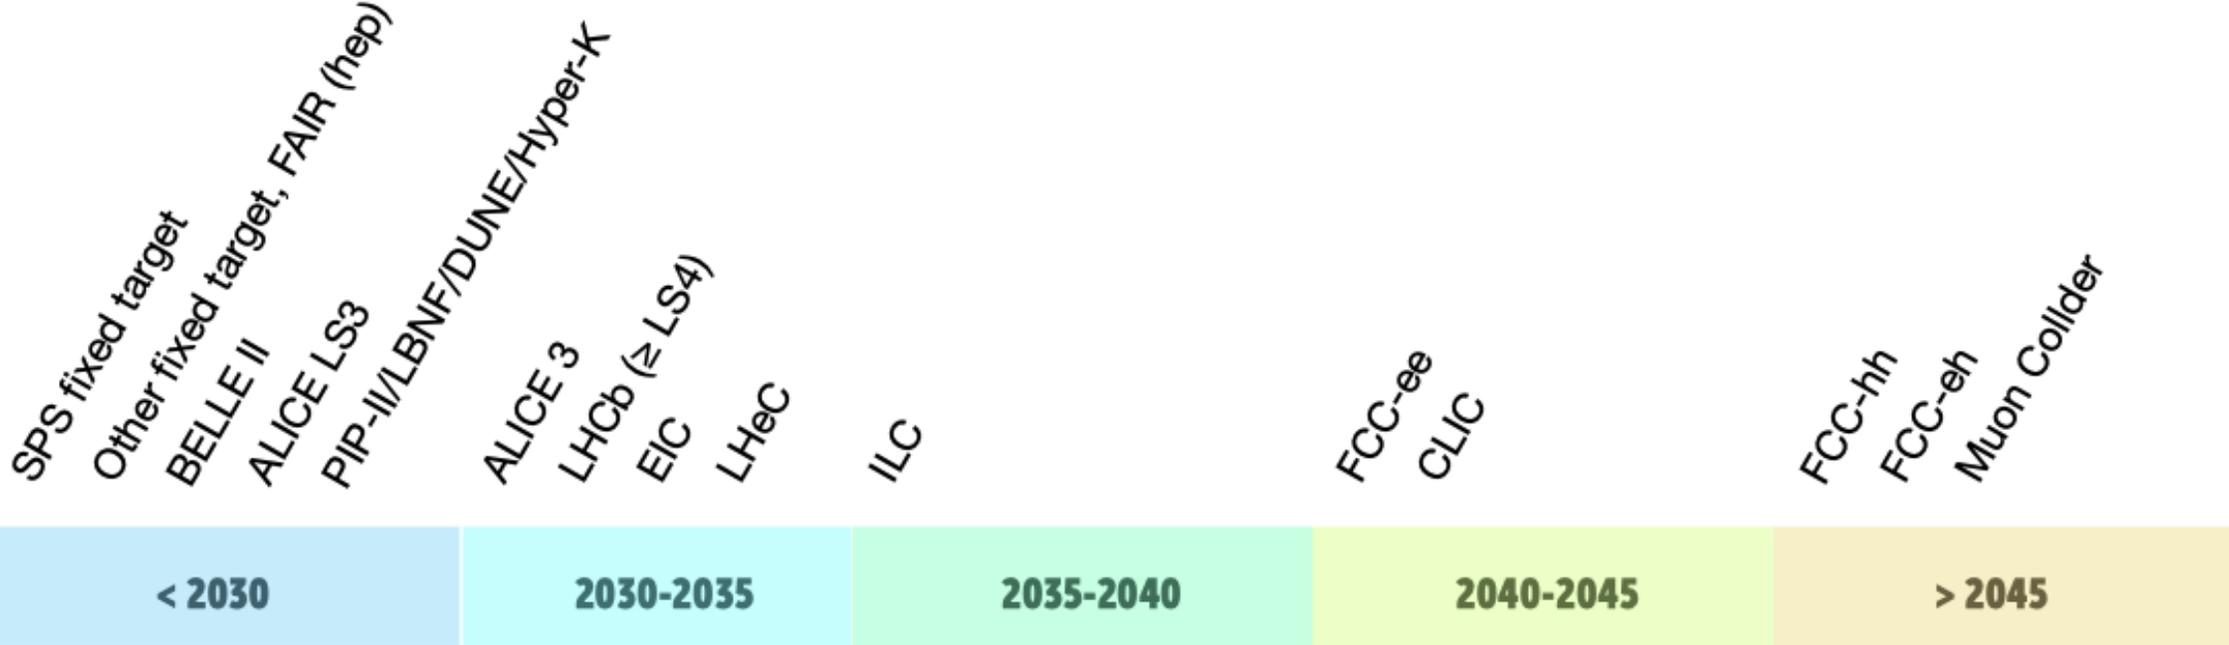

**Input Session speakers provided detailed specifications and continued giving support for the process**

... particularly for checking if there were any unmet detector R&D needs for the ESPP identified programme which may have been overlooked in the symposia programmes.

	Speaker	Presentation Topic
1	Chris Parkes	Detector R&D requirements for HL-LHC
2	Luciano Musa	Detector R&D requirements for strong interaction experiments at future colliders
3	Johannes Bernhard	Detector R&D requirements for strong interaction experiments at future colliders
4	Frank Simon	Detector R&D requirements for future linear high energy e+e- machines
5	Mogens Dam	Detector R&D requirements for future circular high energy e+e- machines
6	Martin Aleksa	Detector R&D requirements for future high-energy hadron colliders
7	Nadia Pastrone	Detector R&D requirements for muon colliders
8	Marzio Nessi	Detector R&D requirements for future short and long baseline neutrino experiments
9	Maarten De Jong	Detector R&D requirements for future astro-particle neutrino experiments
10	Laura Baudis	Detector R&D requirements for future dark matter experiments
11	Cristina Lazzeroni	Detector R&D requirements for future rare decay processes experiments
12	Alexandre Obertelli	Detector R&D requirements for future low energy experiments

# Future Projects Timeline (Accelerator Roadmap)

Accelerator Roadmap - as seen by the Lab Directors Group

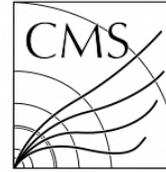

The dates shown in the diagram have low precision, and are intended to represent the earliest “feasible start date” (where a schedule is not already defined), taking into account the necessary steps of approval, development and construction for machine and civil engineering.

# How Much Time Do We Need?

“Random” Examples - and NOT from the start of the R&D

Nuclear Instruments and Methods in Physics Research A309 (1991) 438–449  
North-Holland

t0 -17y

Performance of a liquid argon electromagnetic calorimeter with an “accordion” geometry

RD3 Collaboration

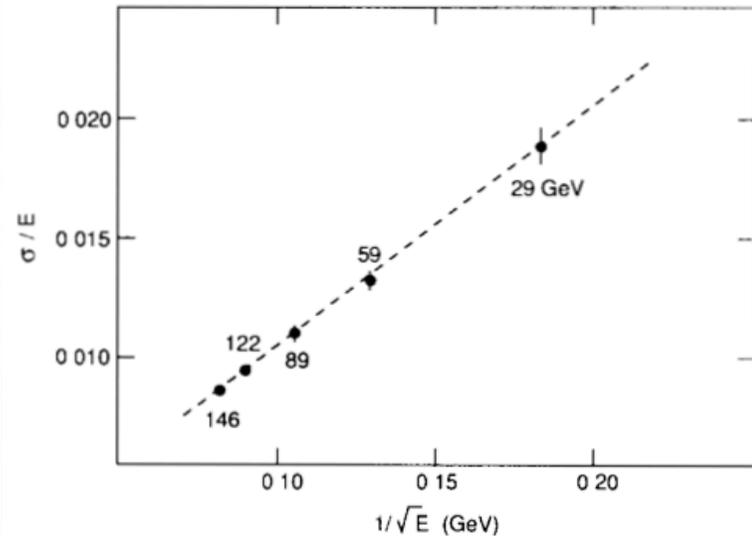

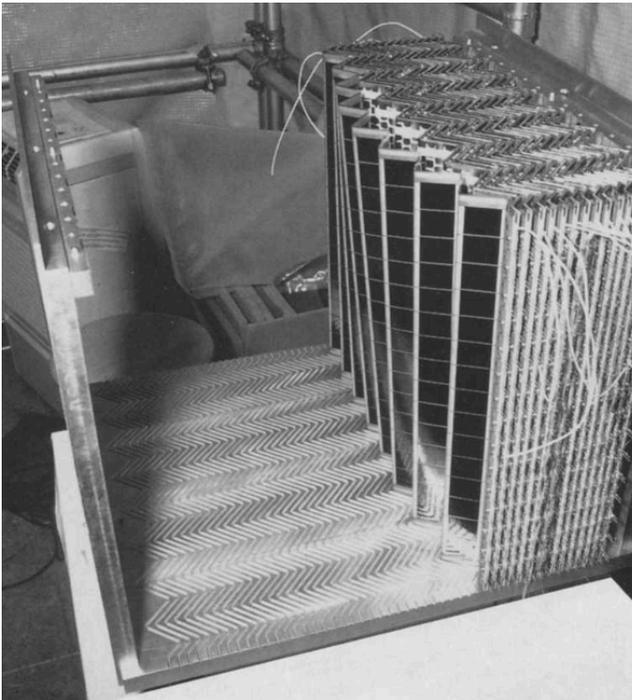

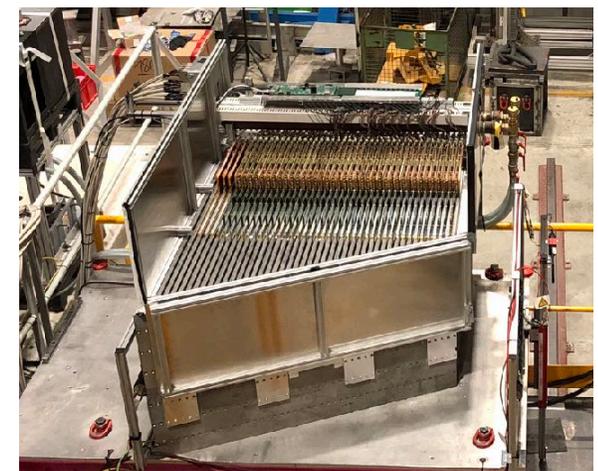

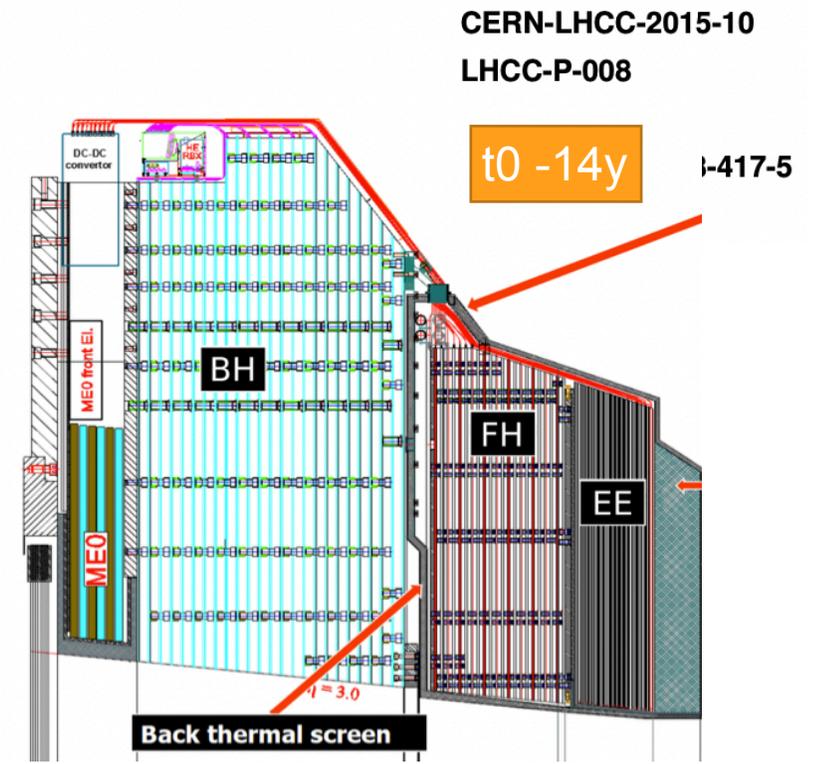

Fig. 6. Energy resolution of the prototype at different electron energies. The dashed line is a linear fit to the experimental points.

CALICE 2018

# Hi-Lumi LHC Detectors Post LS3

Yes...

**Our ability to exploit the HL-LHC is limited by our detector technology: spatial & time resolution, radiation hardness, cost**

## ATLAS

- partial replacement of inter tracker pixels (Ink-Pix)
- and High Granularity Timing Detector (HGTD)
- maybe trigger

## CMS:

- one exchange of the inner part of the pixel detector
- maybe inner rings of Endcap Timing Layer (ETL)
- some ideas to benefit from technology advances (manly forward)

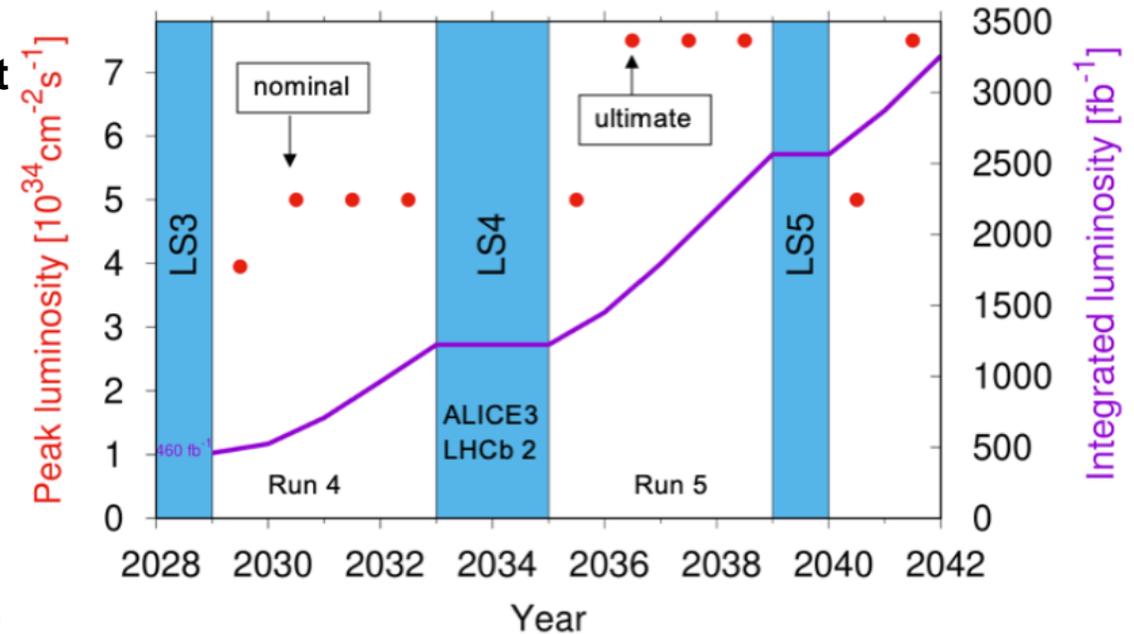

## LHCb: major upgrade in LS4

- Velo, Mighty Tracker, TORCH (PiD), Calorimeter, Muons, 28 nm, ML for Real Time Analysis

## LHC experiments happy to collaborate on R&D across projects

- physics only in one experiment
- technical and engineering staff in multiple experiments
- Technical Associate Memberships

Preliminary (optimistic) schedule of HL-LHC

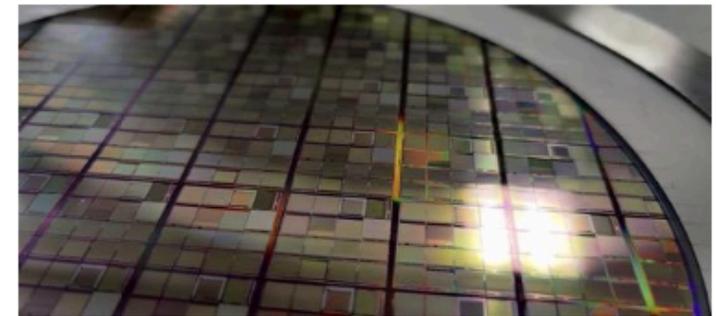

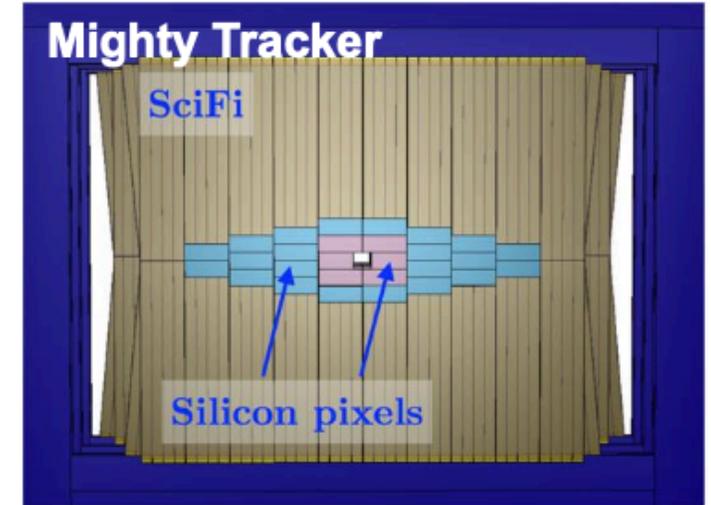

Fair reasons  
not to discuss  
heavy ions here

# TF3: Solid State Detectors

## LHCb Upgrade II : Tracking System

- System before magnet (UT), inside SciFi (MT)
- Requirements:
  - Si Area for LS4 (with aim small scale in LS3)
    - UT Si –  $6\text{m}^2$  . MT Si -  $20\text{m}^2$
  - Pixel size e.g.  $50\times 150, 100\times 300\mu\text{m}^2$
  - Radiation e.g.  $5\times 10^{13}-5\times 10^{14}$   $1\text{MeV } n_{\text{eq}}/\text{cm}^2$
  - Precision timing ?
- R&D: MAPS. **First large-scale rad-hard CMOS detector at LHC**
  - MightyPix based on MuPix/ATLASPix HV-CMOS
  - Other solutions ? Synergy EP R&D , future accelerators ?

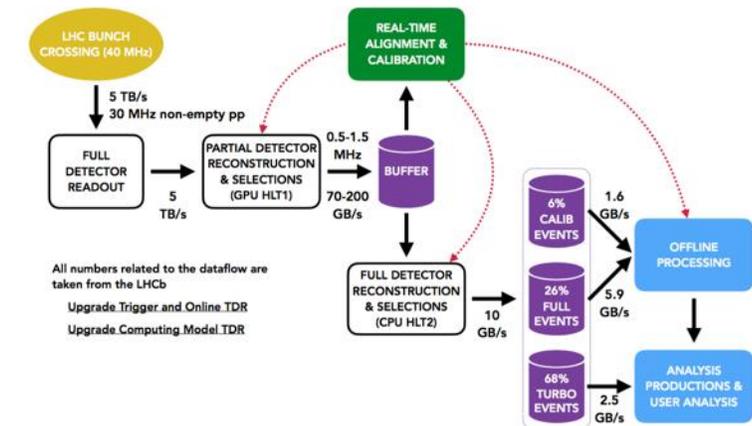

# TF7: Electronics & On-detector Processing

ATLAS/ CMS  
/ LHCb

## LHCb Upgrade II: Trigger & DAQ system

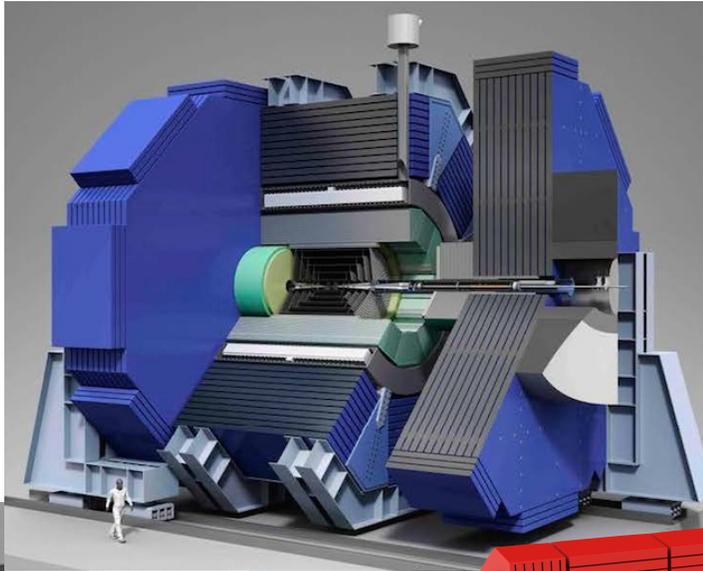

- ASIC feature size CMOS e.g. 28 nm
- CERN support for chips important
- Next-generation rad hard data optical links
  - Low power, low-mass, towards 100 Gbps?
  - with silicon photonics ?
- DC-DC converters – higher input V?
- Processing Both **ON** and **OFF** detector
- Innovative algorithms for real-time trigger applications in **heterogeneous** architectures
  - GPUs, IPU, TPU, FPGAs
- data-centre / commodity / cloud technologies for Online processing?

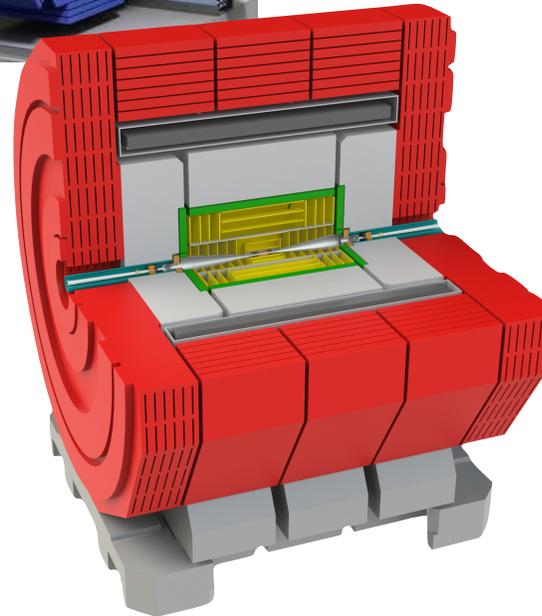

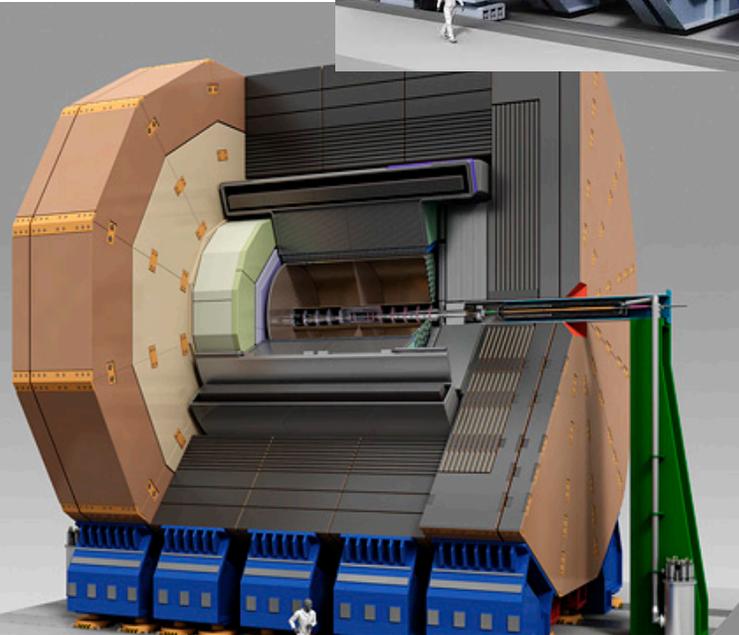

- GPU based real-time HLT1 reconstruction and triggering In LHCb Upgrade I
- U2 foresees 5x data throughput

# The Linear Collider Detector Design - Main Features

*Focusing on general aspects*

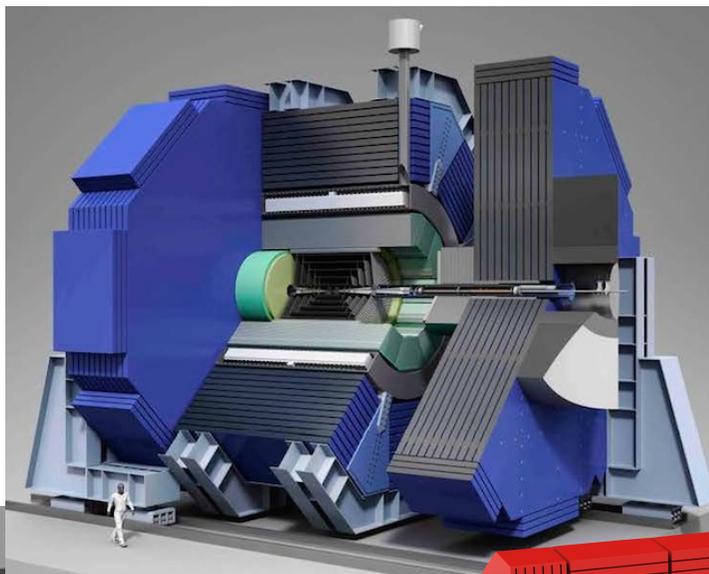

- A **large-volume solenoid** 3.5 - 5 T, enclosing calorimeters and tracking
- **Highly granular calorimeter systems**, optimised for particle flow reconstruction, best jet energy resolution [*Si, Scint + SiPMs, RPCs*]
- **Low-mass main tracker**, for excellent momentum resolution at high energies [*Si, TPC + Si*]
- **Forward calorimeters**, for low-angle electron measurements, luminosity [*Si, GaAs*]
- **Vertex detector**, lowest possible mass, smallest possible radius [*MAPS, thinned hybrid detectors*]
- **Triggerless readout** of main detector systems

# Beyond the Baseline

Possible Ideas going beyond current technology & ideas

particle ID systems - improved flavour tagging  
with better  $\pi/K$  separation via TOF or other means

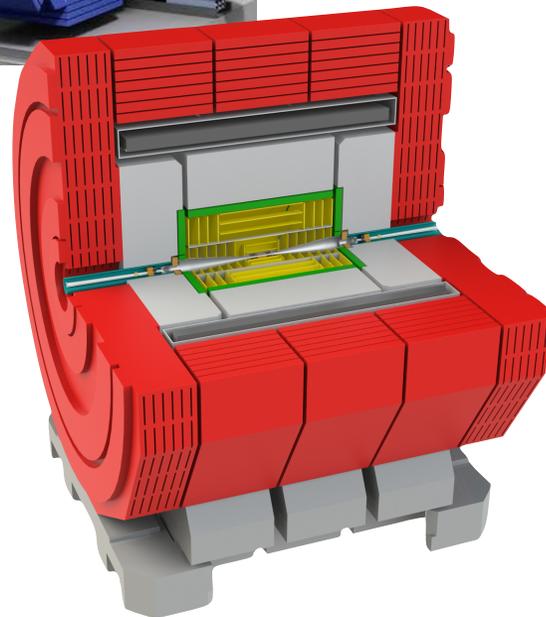

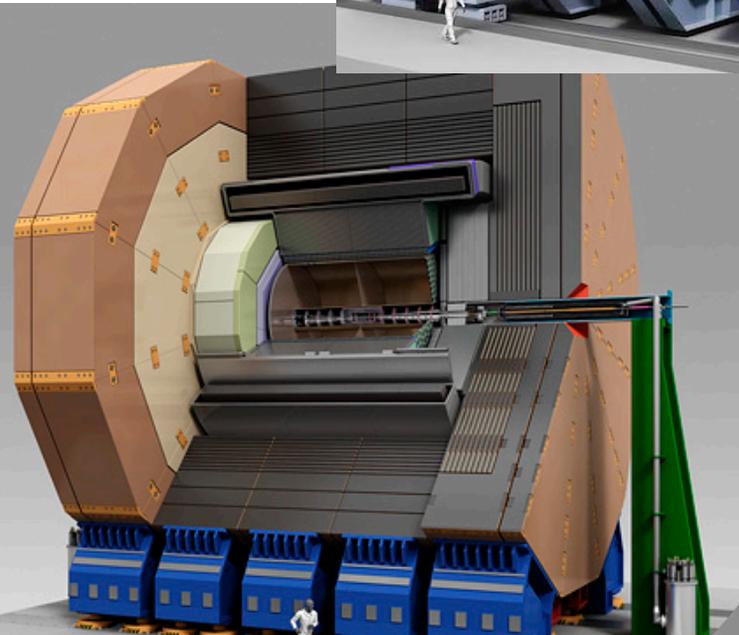

added readout dimensions in calorimetry: highly  
granular dual readout, new optical materials

exploiting ps timing capabilities in  
calorimeters and trackers

highly pixelated sensors throughout  
all silicon systems of the detectors

New radiation hard sensor materials for  
forward instrumentation

Ultra-low mass mechanics, ultra-low mass &  
ultra-low power interfaces and services

# Requirements

1st Order

## e<sup>+</sup>e<sup>-</sup> physics performance requirements

Note: differences between requirements ILC, CLIC, FCC-ee, CEPC rather small

### Second Order Corrections:

#### Experimental conditions

- bunch structure
- background
- constraints on experimental magnetic field

#### Energy and luminosity

- higher or lower c.m. energies emphasise different detector properties
- extremely high luminosity on Z pole: challenge for systematics

★ **momentum resolution:**  
e.g. HZ recoil,  $g_{H\mu\mu}$ , Smuon endpoint

$$\sigma_{p_T} / p_T^2 \sim 2 \times 10^{-5} \text{ GeV}^{-1}$$

★ **jet energy resolution:**  
e.g. W/Z/H di-jet mass separation, Z and W width, HZ with Z → qq, background reduction

$$\frac{\sigma_E}{E} \sim 3.5 - 5 \%$$

(for high-E jets, light quarks)

★ **impact parameter resolution:**  
e.g. c/b-tagging, Higgs branching ratios

$$\sigma_{r\phi} = 5 \oplus 15 / (p[\text{GeV}] \sin^{\frac{3}{2}} \theta) \mu\text{m}$$

★ **angular coverage, very forward electron tagging**

+ requirements from experimental conditions

Linssen, Granada symposium 2019

# From Linear to Circular e+e- Colliders

## Conceptual Adaptations

### Lower energy jets and particles, less collimated jets:

- reduced calorimeter depth
- shift imaging vs. energy resolution balance towards the latter
- jet assignment ambiguities: added value of  $\pi^0 \rightarrow \gamma\gamma$  mass reconstruction
- tracking even more multiple-scattering dominated: **increased pressure on material budget of vertex detector and main tracker**
  - fresh air to gaseous tracking

### Limitations on solenoidal field $B < 2T$ , to preserve luminosity:

- recover momentum resolution with tracker radius
- on the other hand larger magnetic volume also more easily affordable (coil and yoke)

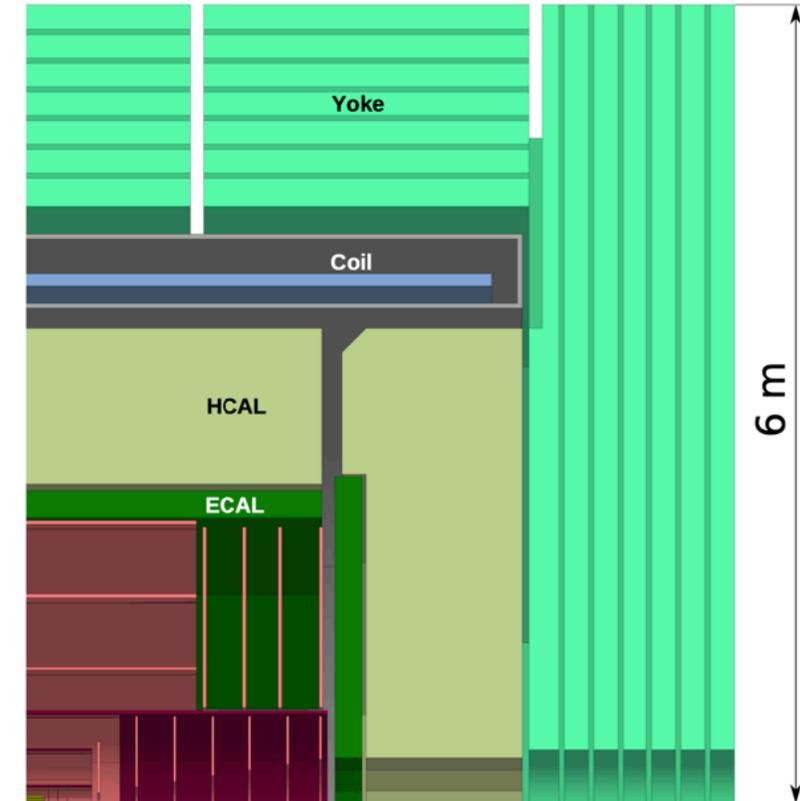

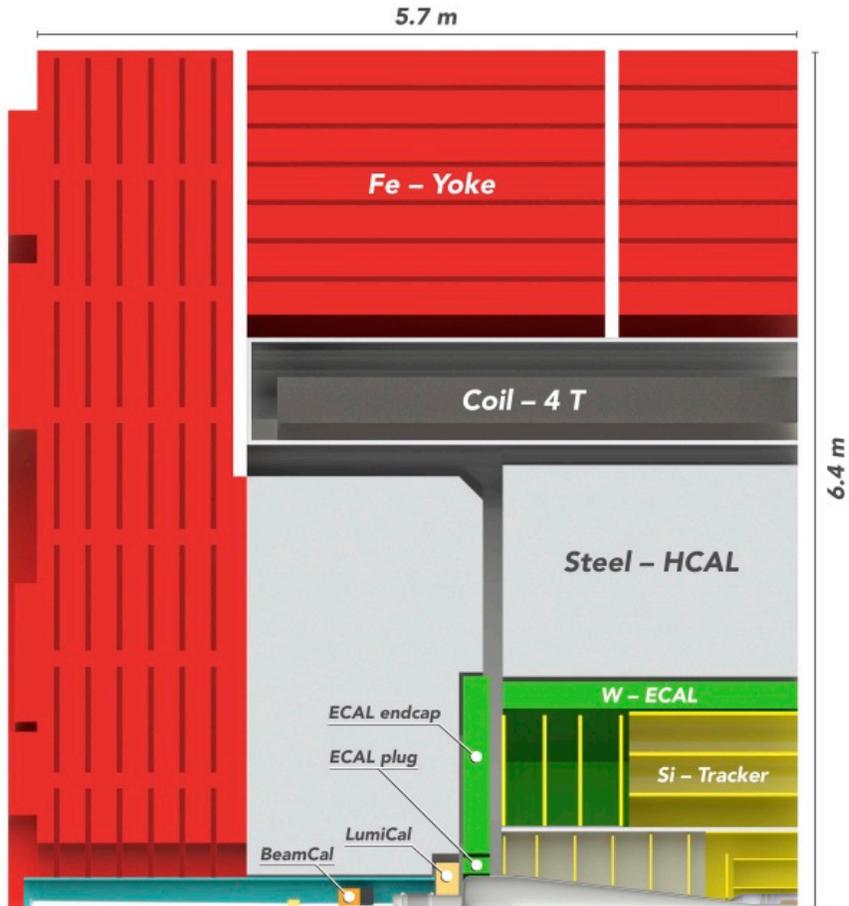

### Main difference: no bunch trains; collisions every 20 ns (~ at LHC)

- **no power pulsing, more data bandwidth: both imply larger powering and cooling needs**
- **adds material to the trackers and compromises calorimeter compactness - or reduce granularity, timing, speed**
- **implications strongly technology-dependent, interesting optimisation challenges**
- **Trigger and DAQ re-enter the stage**

# From LCs to FCCee

# CLD: CLIC-like Detector for FCCee

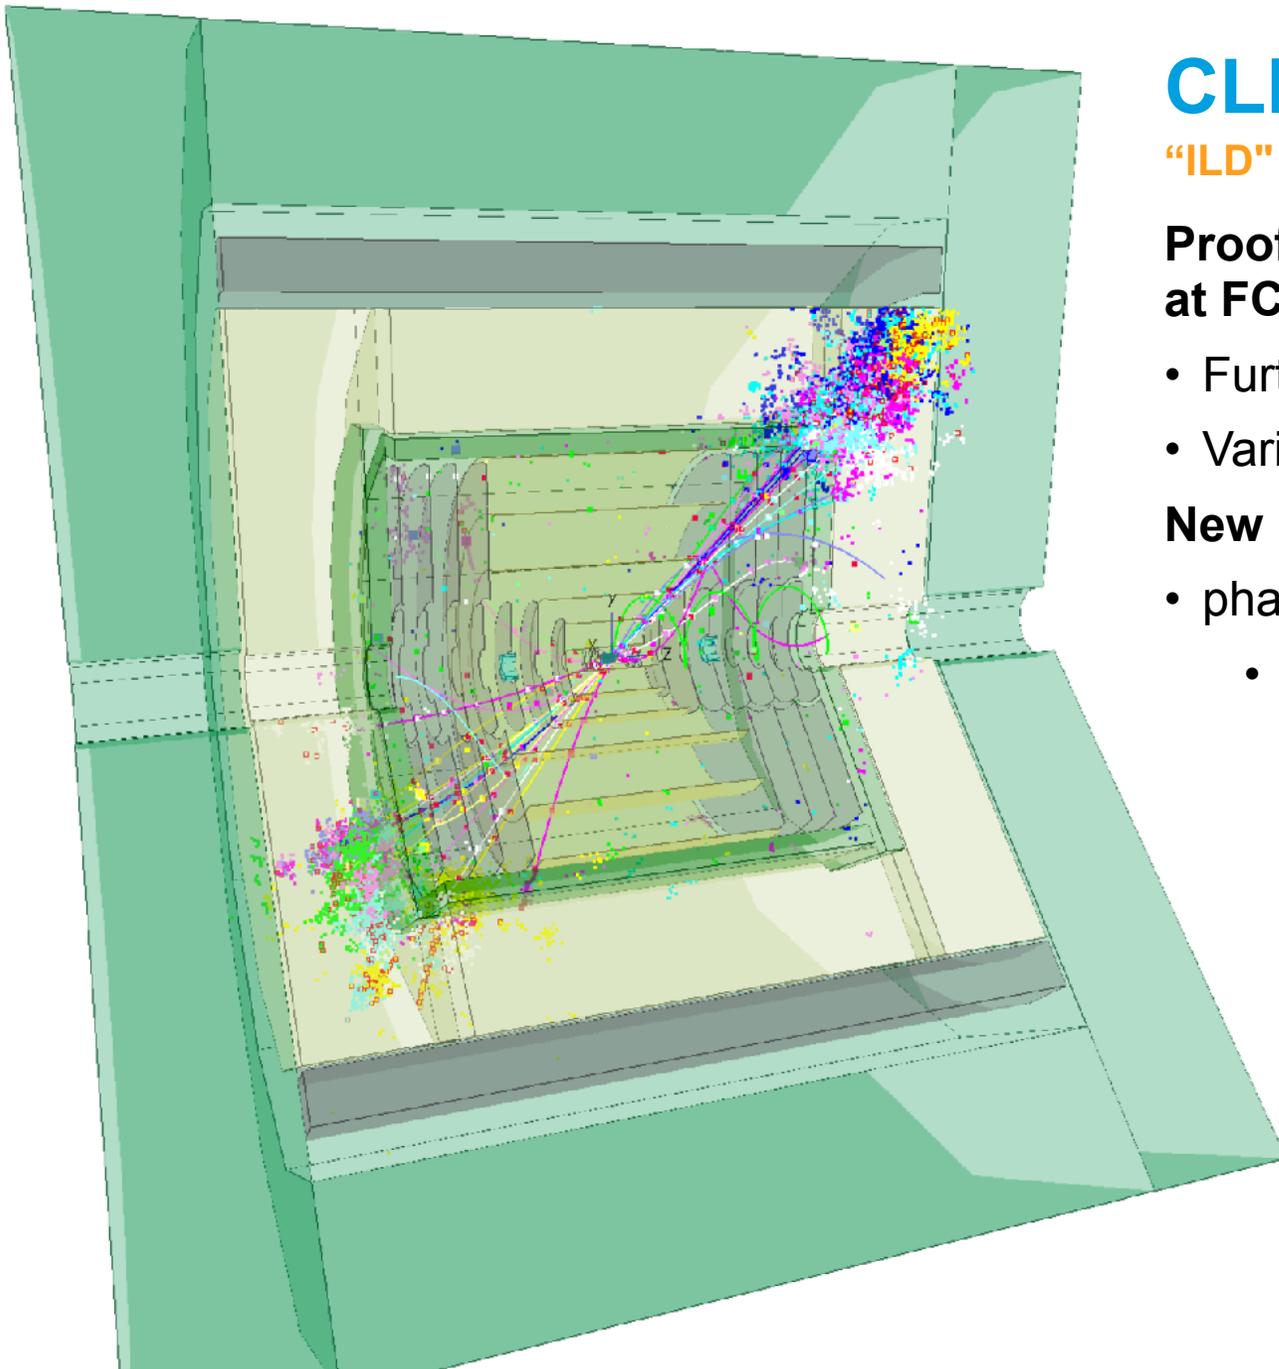

“ILD” (with Gaseous Tracking) also Possible

**Proof-of-principle for a particle-flow detector concept at FCCee**

- Further optimisation possible - and likely
- Variants also (e.g. gaseous tracker, gaseous HCAL,...)

**New ideas and technologies**

- phase space largely overlaps with that for LCs
  - e.g. fast timing for particle ID, new tracker read-out schemes, more compact electronics,...

# CLD: CLIC-like Detector for FCCee

“ILD” (with Gaseous Tracking) also Possible

**Proof-of-principle for a particle-flow detector concept at FCCee**

- Further optimisation possible - and likely
- Variants also (e.g. gaseous tracker, gaseous HCAL,...)

**New ideas and technologies**

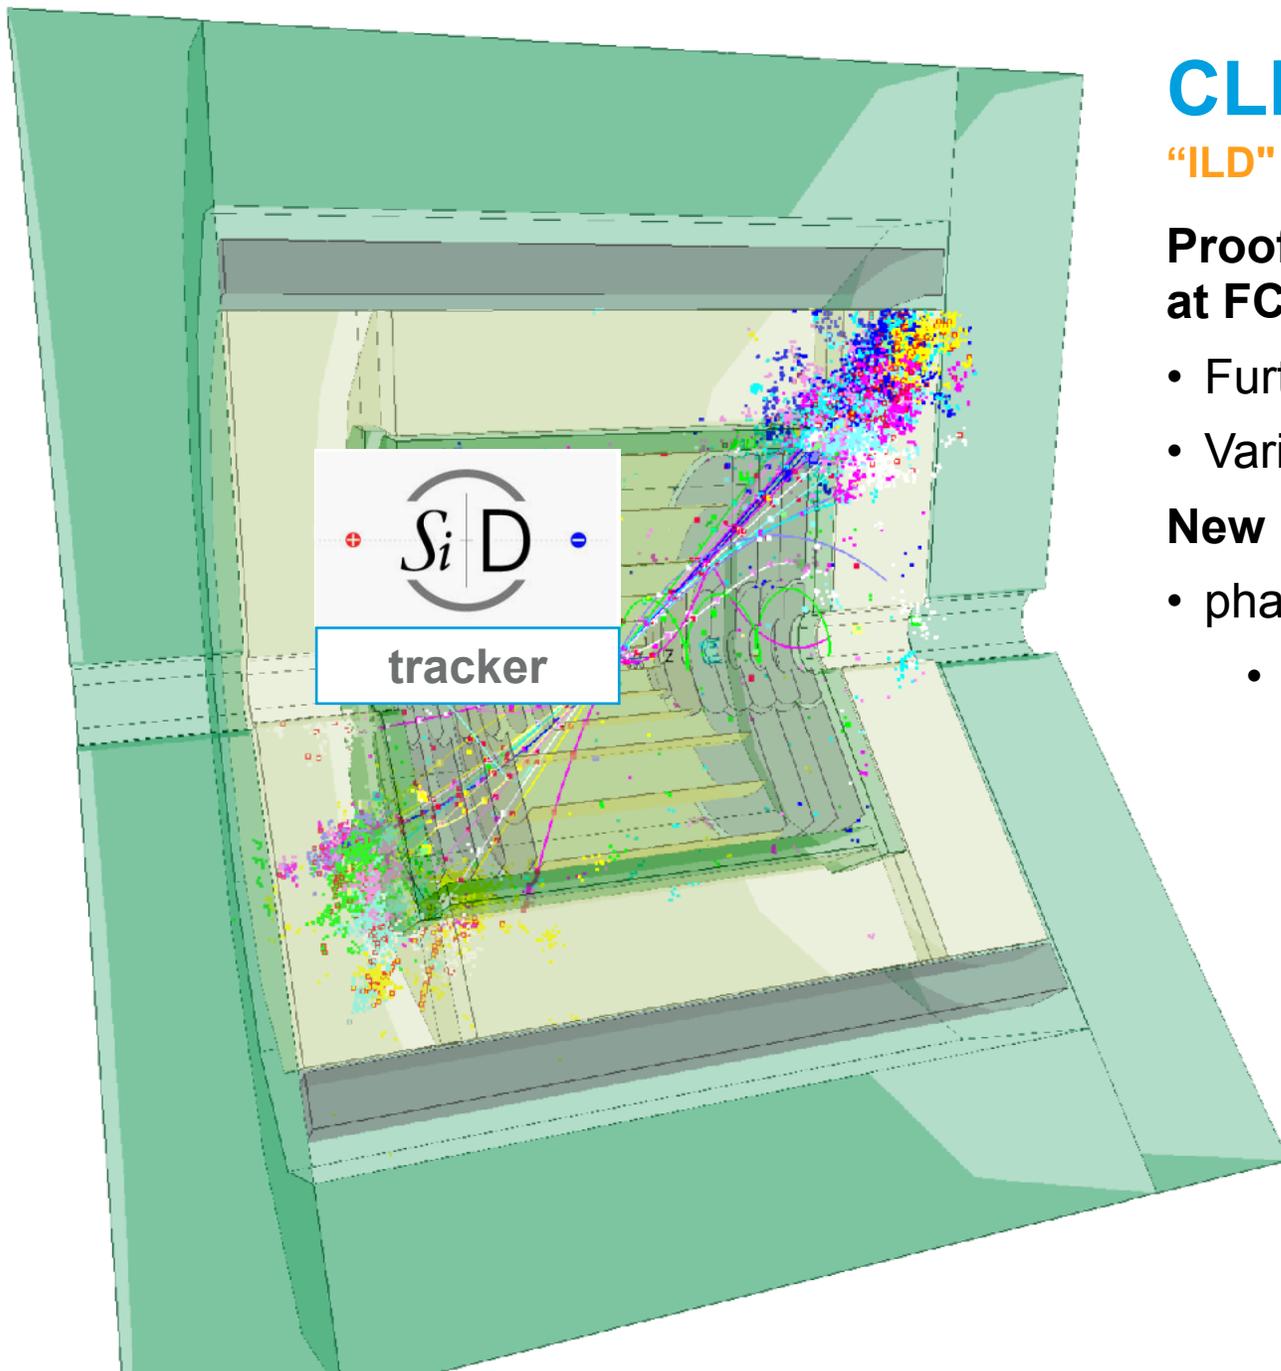

- phase space largely overlaps with that for LCs
  - e.g. fast timing for particle ID, new tracker read-out schemes, more compact electronics,...

**Inherits ILC and CLIC assets**

- software framework **key4HEP (DESY)**
- performance validation with prototypes

**However, in most if not all cases feasibility of continuous readout, including power and cooling is still to be demonstrated - clear R&D path**

- benefit from HL-LHC upgrades, e.g. CMS HGCAL
- **need engineers already in R&D phase**

# CLD: CLIC-like Detector for FCCee

“ILD” (with Gaseous Tracking) also Possible

**Proof-of-principle for a particle-flow detector concept at FCCee**

- Further optimisation possible - and likely
- Variants also (e.g. gaseous tracker, gaseous HCAL,...)

# R&D Overview

## Synergies Dominate

Detector Technology	Linear & Circular Colliders common R&D	Differences
<b>All</b>	test infrastructure prototype electronics software for reconstruction and optimisation	readout rates power and cooling requirements
<b>Silicon Vertex and Track Detectors</b>	highest granularity and resolution, timing ultra-thin sensors and interconnects simulation and design tools low-mass support structures cooling micro-structures	emphasis on timing (background) and position resolution
<b>Gaseous Trackers and Muon Chambers</b>	ultra-light structures for large volumes industrialisation for large area instrumentation eco-friendly gases	DC and TPC presently considered only at some colliders
<b>Calorimeters and Particle ID</b>	highly compact structures and interfaces advanced photo-sensors and optical materials ps timing sensors and electronics	emphasis on granularity and stability DR and LAr presently only considered for circular

- **Requirements for future experiments envisaged by the European Strategy form the starting point**
- **A - coarsely binned - timeline of future projects was provided by the parallel accelerator roadmap process driven by the lab directors group**
- **Detector development for colliders has a lead time of 10 - 20 years - less for pixels, more for calorimeters**
- **Detectors for linear or circular Higgs factories have much in common - so FCCee does not start from zero, but it poses a well defined set of open challenges**

# Open Symposia

# Open Symposia

## Symposia

Nine one-day symposia took place as listed below. The attendance was as follows.

	TF7	TF8	TF2	TF5	TF3	TF1	TF9	TF4	TF6
Unique users	369 + 123 webcast*	154 + 17 webcast*	197 + 5 webcast*	220	504	339	105	207	201
Max. number of concurrent views	230 + 123 webcast*	76 + 17 webcast*	130 + 5 webcast*	100	275	191	59	110	115

\* Might have overlapping users.

Thanks a lot for attending and contributing to the discussions!

# Sensors for future trackers

## Welcome: Introduction

Conveners: Philip Patrick Allport (University of Birmingham (UK)), Nicolo Cartiglia (INFN Torino (I

European Committee  
for Future Accelerators

## Building the Foundations

"Strong planning and appropriate investments in Research and Development (R&D) in relevant technologies are essential for the full potential, in terms of novel capabilities and discoveries, to be realised."

The field of particle physics builds on the major scientific revolutions of the 20th century, particularly on the experimental discoveries and theoretical developments which culminated in the Nobel Prize-winning discovery of the Higgs boson at CERN in 2012. The ambitions for the field going forward are set out from a European perspective in a global context in the European Strategy for Particle Physics (ESPP) which was updated in 2020. This strategy lays down a vision for the coming half-century, with a science programme which, in exploring matter and forces at the smallest scales and the Universe at earliest times, will continue to provide answers to questions once thought only to be amenable to philosophical speculation, and has the potential to reveal fundamentally new phenomena or forms of matter never observed before.

The ESPP recognises the huge advances in accelerator and detector technologies since the world's first hadron collider, the Intersecting Storage Rings, started operation at CERN 50 years ago. These advances have not only supported, and in turn benefited from, numerous other scientific disciplines but have spawned huge societal through developments such as the World Wide Web, Magnetic Resonance Imaging, Positron Emission Tomography and 3D X-ray

Quartz fibres from a silicon pixel detector, which capture and measure the path of ionising particles. (© CERN)

Imagery of the CMS Central Tracking Detector with 10-million read-out channels using silicon detectors covering an area of over 200 m<sup>2</sup>. (© CERN)

The far-reaching plans of the ESPP require similar progress over the coming decades in accelerator and detector capabilities to deliver its rich science programme. Strong planning and appropriate investments in Research and Development (R&D) on relevant technologies are essential for the full potential, in terms of novel capabilities and discoveries, to be realised.

The 2020 update of the ESPP called on the European Committee for Future Accelerators (ECFA) to develop a global Detector R&D Roadmap defining the backbone of detector R&D required to deploy the community's vision. This Roadmap aims to cover the needs of both the near-term and longer-term programmes, working in synergy with neighbouring fields and with a view to potential industrial applications.

Neutrino Detector (ND) of the LHC experiment allowing ultra-fast particle detection at the LHC. (© CERN)

## Identifying the Tools

"It is vital to build on Europe's world-leading capabilities in sensor technologies for particle detection."

The figure opposite illustrates the "Detector R&D Themes" (DRDTs) and "Detector Community Themes" (DCTs) identified in the Roadmap process, grouped according to the areas addressed by the nine task forces set up by ECFA to develop a strategy for future detector R&D priorities. All the themes are critical to achieving the science programme outlined in the ESPP and are derived from the technological challenges that need to be overcome for the scientific potential of the future facilities and projects listed in the ESPP to be realised. It is important to ensure that, for each of the future facilities mentioned in the ESPP, detector readiness should not be the limiting factor in terms of when the facility in question can be realised. In many cases, less demanding developments are required for experiments scheduled in the medium term, which can then act as "stepping stones" (illustrated by the in-between dots) towards achieving the final specifications.

The R&D priorities are outlined for the key detector types: those based on gaseous, liquid or solid sensing materials; along with those required for sensing aspects specific to photon detection, particle identification (PID) or energy measurement (calorimetry). In addition, quantum sensors are already offering radically new opportunities to particle physics, and their further development will widen their applicability to the field. Sophisticated read-out technologies are essential to all detector types and are often the limiting factor when very large numbers of channels are to be instrumented, especially given the ever more demanding sensitivity and robustness required for operation in the extreme conditions of many particle physics experiments. Unique advanced engineering solutions are needed to complement all these detector developments and, as with accelerators, the field drives many aspects of progress in magnet technology. Last but not least, environmental sustainability is a central requirement for all future research and innovation activities.

Given the vital importance of expertise in a wide range of cutting-edge technologies, the Detector R&D Roadmap also contains specific recommendations in terms of training. Detector Community Themes with emphasis on providing better coordination between the many different training schemes available across Europe, and exploring mechanisms to establish a core syllabus for a Masters qualification in particle physics instrumentation that brings together the crucial elements from the large number of diverse existing courses. Given the uneven access to training in the area of instrumentation in all regions of the world, a key focus is to greatly improve the industry of future programmes, workshops and schools, encouraging the widest possible diversity of participants.

While defining the priorities within particle physics, as outlined above, the ECFA Detector R&D Roadmap also emphasises the vital importance of benefiting from synergies with adjacent research fields, knowledge institutions and high-technology industries.

**ECFA**  
European Committee  
for Future Accelerators

# ECFA Detector Roadmap Summary

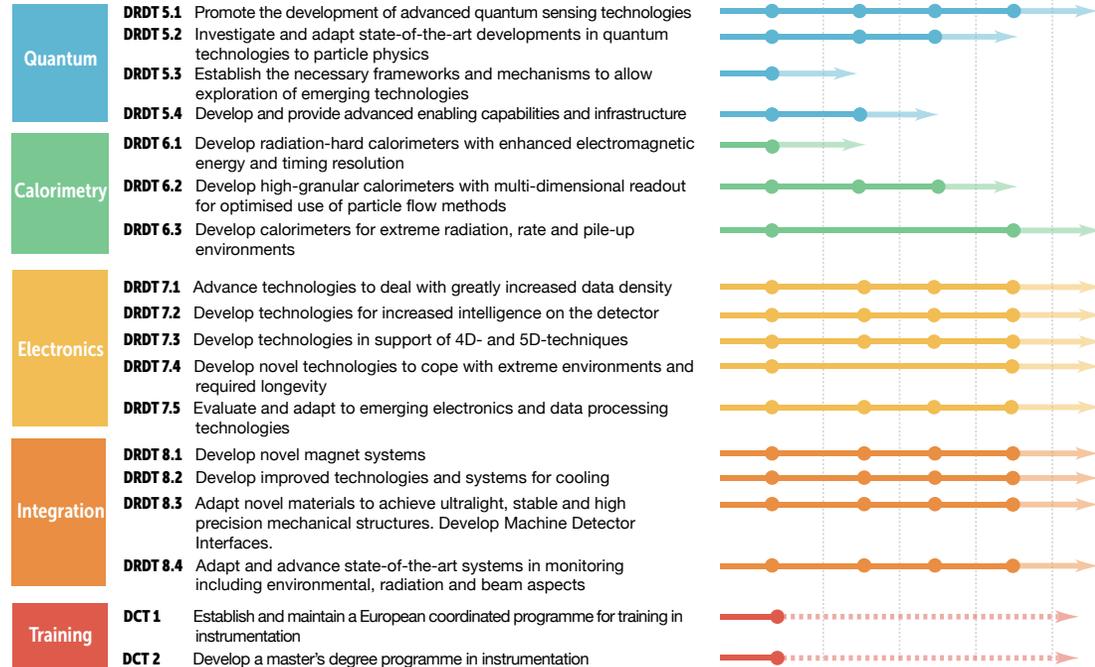

## Relating Technology R&D to Major Drivers from Facilities

### DETECTOR RESEARCH AND DEVELOPMENT THEMES (DRDTs) & DETECTOR COMMUNITY THEMES (DCTs)

Dates when R&D finished and real engineering & construction can start

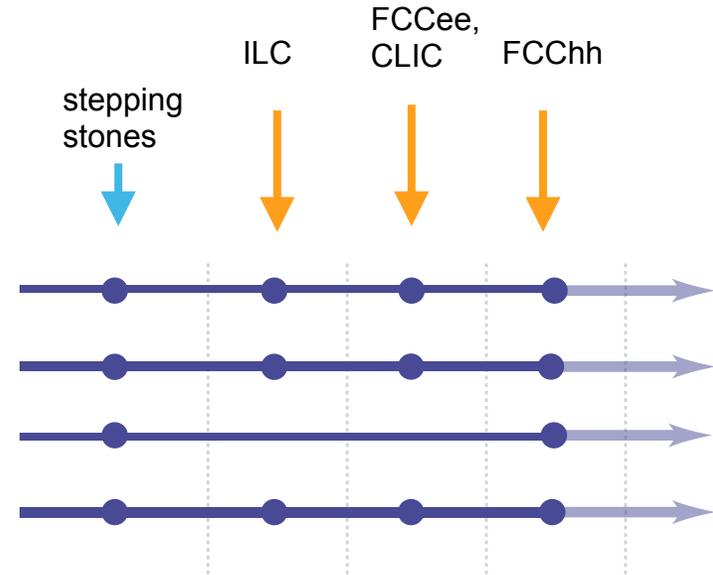

**Detector R&D Themes (DRDTs) and Detector Community Themes (DCTs).** Here, except in the DCT case, the final dot position represents the target date for completion of the R&D required by the latest known future facility/experiment for which an R&D programme would still be needed in that area. The time from that dot to the end of the arrow represents the further time to be anticipated for experiment-specific prototyping, procurement, construction, installation and commissioning. Earlier dots represent the time-frame of intermediate "stepping stone" projects where dates for the corresponding facilities/experiments are known. (Note that R&D for Liquid Detectors will be needed far into the future, however the DRDT lines for these end in the period 2030-35 because developments in that field are rapid and it is not possible today to reasonably estimate the dates for projects requiring longer-term R&D. Similarly, dotted lines for the DCT case indicate that beyond the initial programmes, the activities will need to be sustained going forward in support of the instrumentation R&D activities).

# ECFA Detector Roadmap Summary: TF3

## Relating Technology R&D to Major Drivers from Facilities

Example:  
Solid State Detectors

- Solid state**
- DRDT 3.1** Achieve full integration of sensing and microelectronics in monolithic CMOS pixel sensors
  - DRDT 3.2** Develop solid state sensors with 4D-capabilities for tracking and calorimetry
  - DRDT 3.3** Extend capabilities of solid state sensors to operate at extreme fluences
  - DRDT 3.4** Develop full 3D-interconnection technologies for solid state devices in particle physics

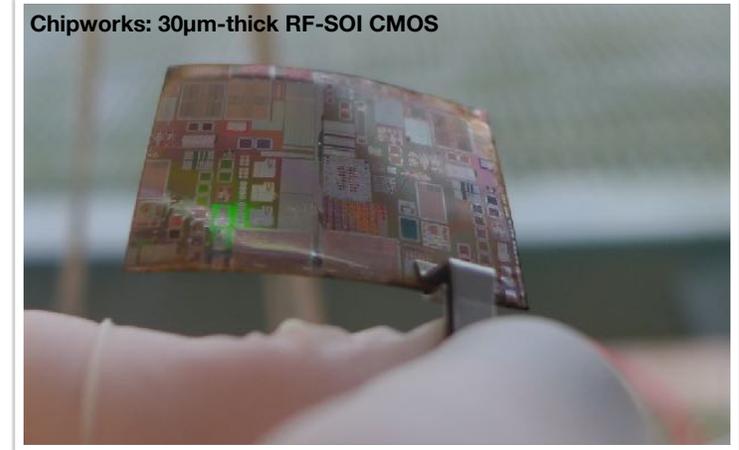

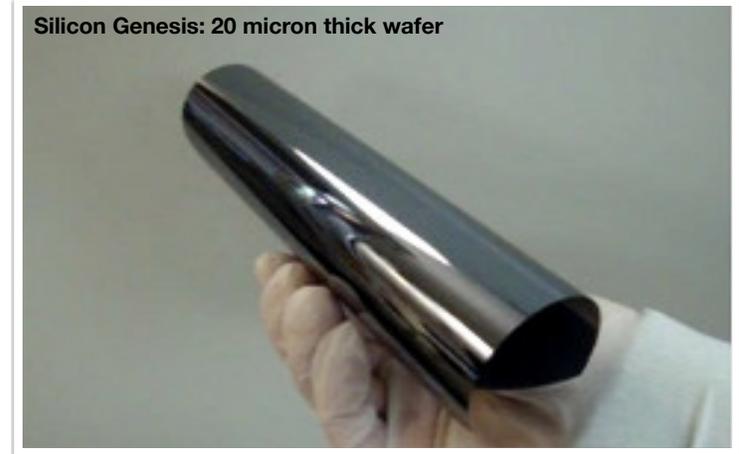

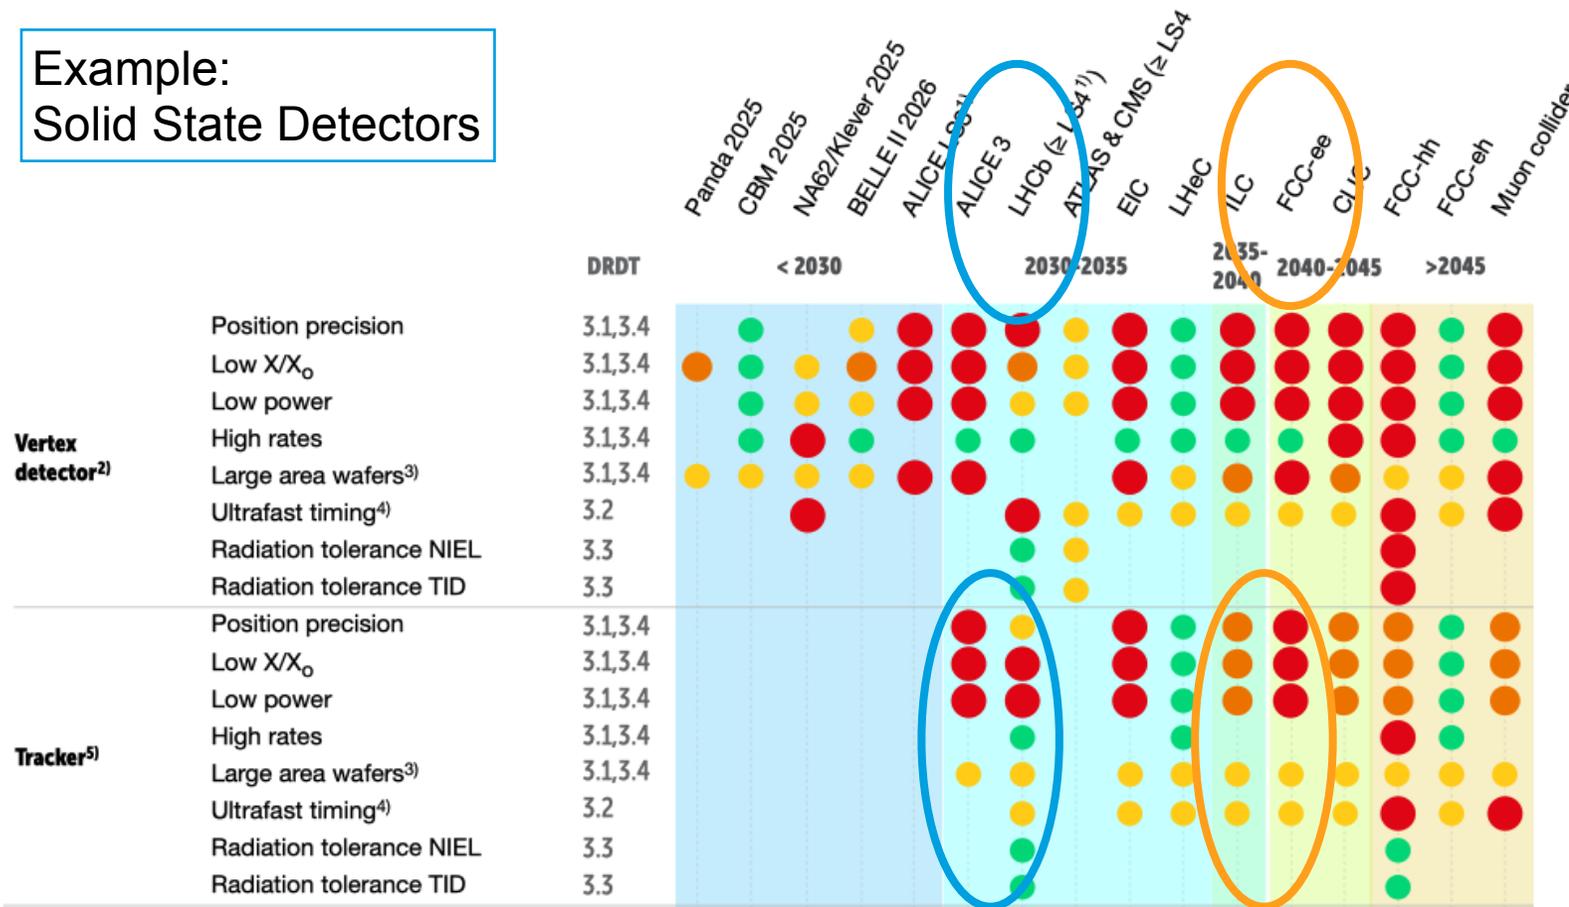

"Technical" Start Date of Facility (This means, where the dates are not known, the earliest technically feasible start date is indicated - such that detector R&D readiness is not the delaying factor)			< 2030					2030-2035				2035 - 2040	2040-2045		> 2045

# Synergies, Stepping Stones, R&D collaborations

Looking Across the Fence, and Beyond Tomorrow

Example:  
Solid State Detectors

Magnus Mager (CERN) | ALICE ITS3 | CERN detector seminar | 24.09.2021 | 9

● Must happen or main physics goals cannot be met ● Important to meet several physics goals ● Desirable to enhance physics reach ● R&D needs being met

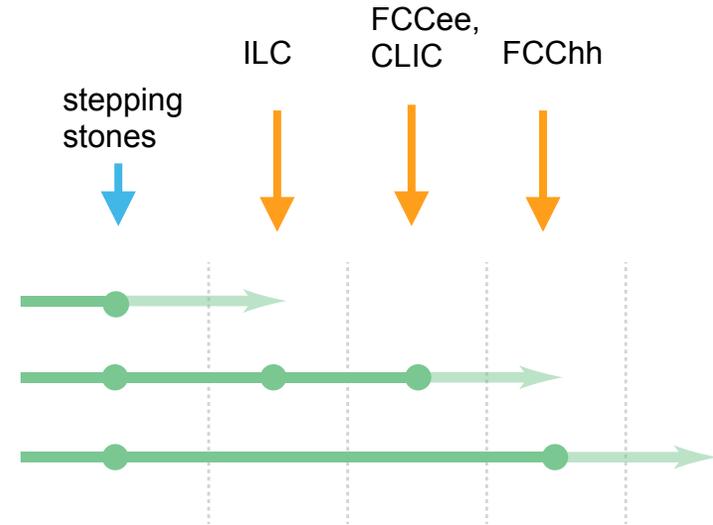

# ECFA Detector Roadmap Summary: TF6

## Relating Technology R&D to Major Drivers from Facilities

Example:  
Calorimeters

### Calorimetry

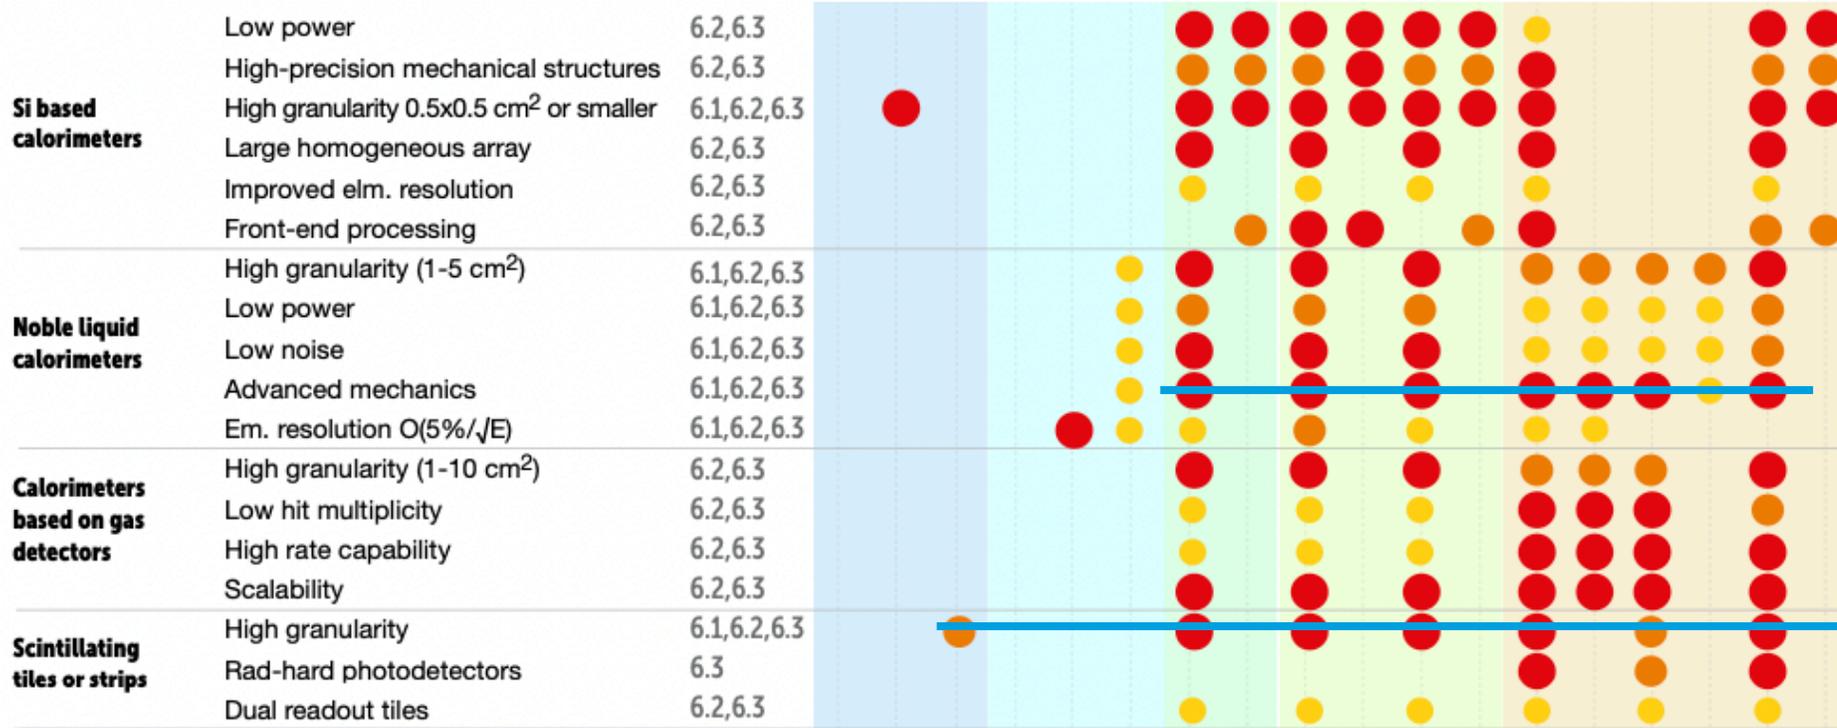

- DRDT 6.1** Develop radiation-hard calorimeters with enhanced electromagnetic energy and timing resolution
- DRDT 6.2** Develop high-granular calorimeters with multi-dimensional readout for optimised use of particle flow methods
- DRDT 6.3** Develop calorimeters for extreme radiation, rate and pile-up environments

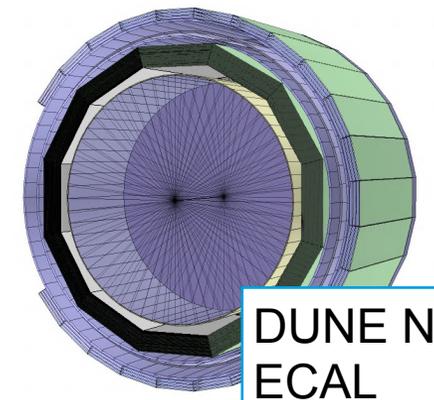

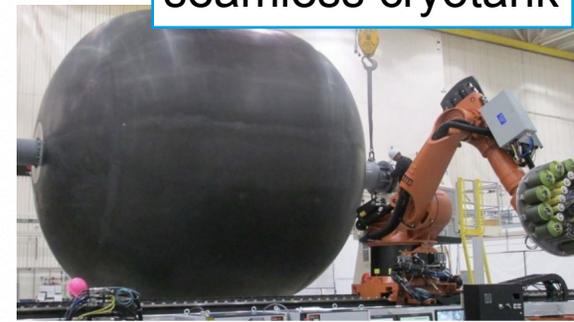

# Synergies, Stepping Stones, R&D collaborations

Looking Across the Fence, and Beyond Tomorrow

Example:  
Calorimeters

NASA  
seamless cryotank

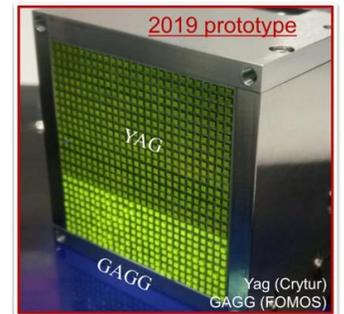

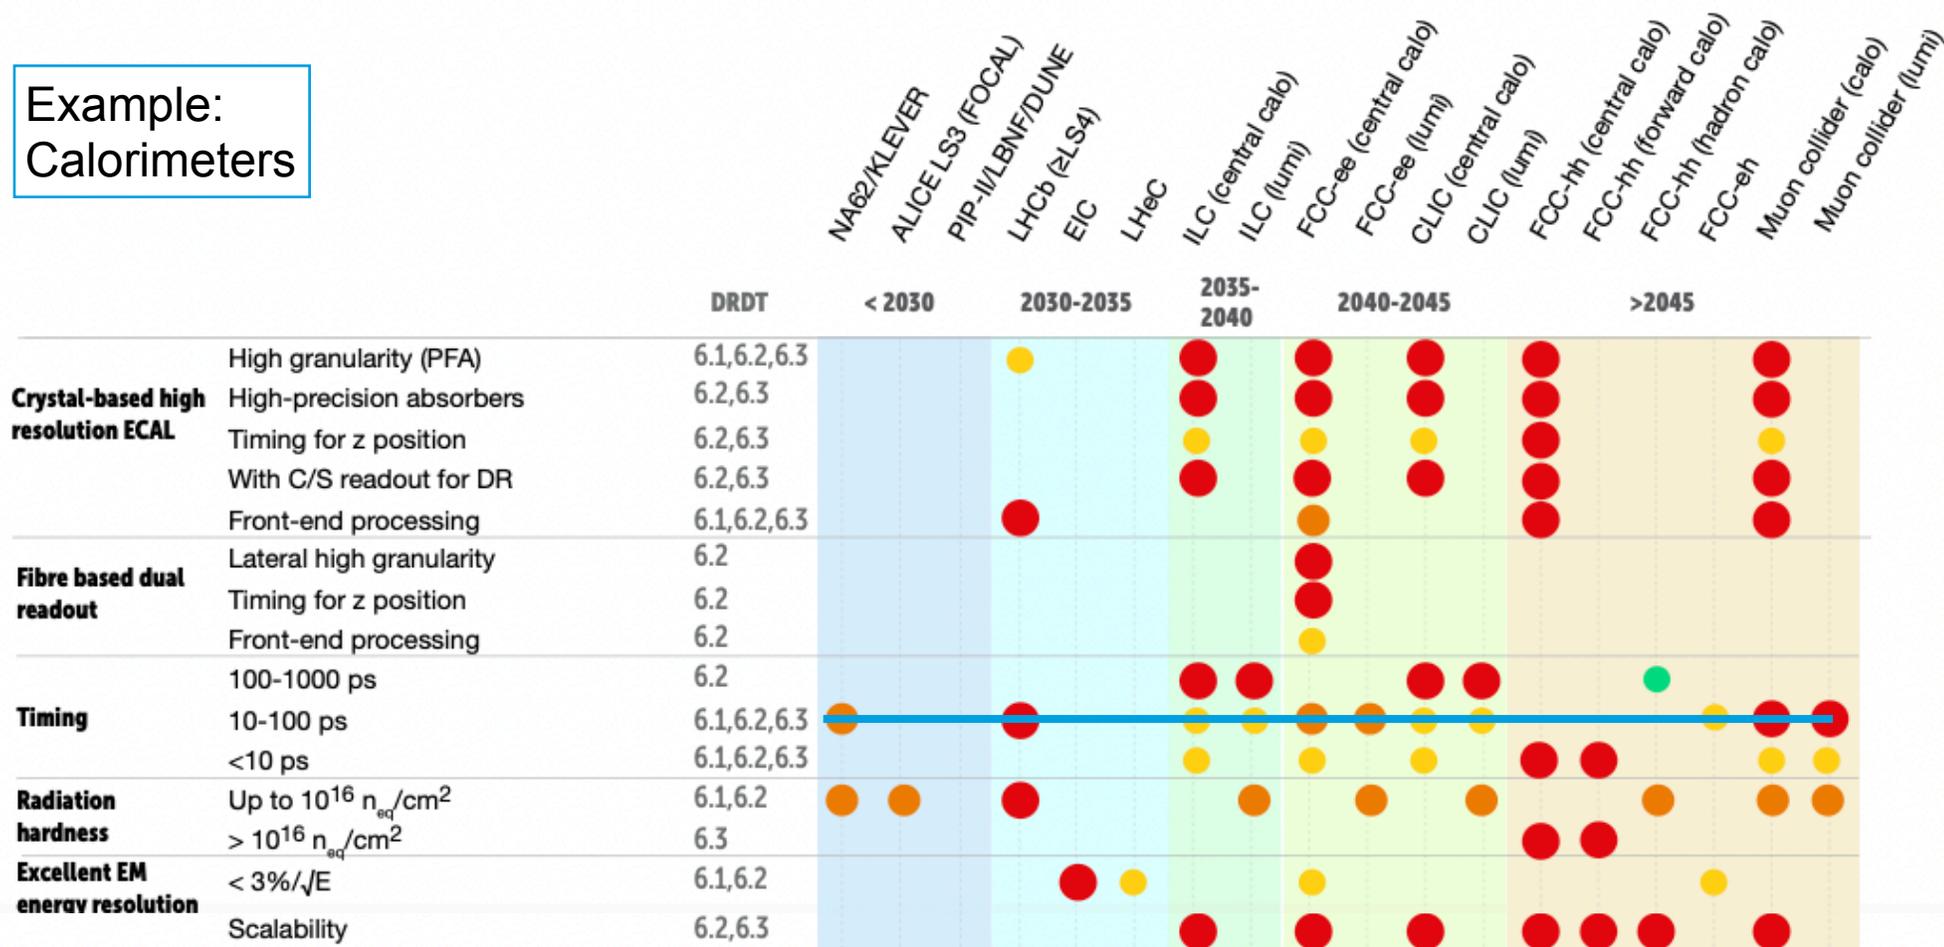

DUNE ND  
ECAL

● Must happen or main physics goals cannot be met ● Important to meet several physics goals ● Desirable to enhance physics reach ● R&D needs being met

# Synergies, Stepping Stones, R&D collaborations

Looking Across the Fence, and Beyond Tomorrow

Example:  
Calorimeters

Fast timing  
SPACAL

● Must happen or main physics goals cannot be met ● Important to meet several physics goals ● Desirable to enhance physics reach ● R&D needs being met

**GSR 1 - Supporting R&D facilities**

It is recommended that the structures to provide Europe-wide coordinated infrastructure in the areas of: test beams, large scale generic prototyping and irradiation be consolidated and enhanced to meet the needs of next generation experiments with adequate centralised investment to avoid less cost-effective, more widely distributed, solutions, and to maintain a network structure for existing distributed facilities, e.g. for irradiation

**GSR 2 - Engineering support for detector R&D**

In response to ever more integrated detector concepts, requiring holistic design approaches and large component counts, the R&D should be supported with adequate mechanical and electronics engineering resources, to bring in expertise in state-of-the-art microelectronics as well as advanced materials and manufacturing techniques, to tackle generic integration challenges, and to maintain scalability of production and quality control from the earliest stages.

**GSR 3 - Specific software for instrumentation**

Across DRDTs and through adequate capital investments, the availability to the community of state-of-the-art R&D-specific software packages must be maintained and continuously updated. The expert development of these packages - for core software frameworks, but also for commonly used simulation and reconstruction tools - should continue to be highly recognised and valued and the community effort to support these needs to be organised at a European level.

**GSR 4 - International coordination and organisation of R&D activities**

With a view to creating a vibrant ecosystem for R&D, connecting and involving all partners, there is a need to refresh the CERN RD programme structure and encourage new programmes for next generation detectors, where CERN and the other national laboratories can assist as major catalysers for these. It is also recommended to revisit and streamline the process of creating and reviewing these programmes, with an extended framework to help share the associated load and increase involvement, while enhancing the visibility of the detector R&D community and easing communication with neighbouring disciplines, for example in cooperation with the ICFA Instrumentation Panel.

**GSR 1 - Supporting R&D facilities**

It is recommended that the structures to provide Europe-wide coordinated infrastructure in the areas of: test beams, large scale generic prototyping and irradiation be consolidated and enhanced to **Testbeam!** of next generation experiments with adequate centralised investment to avoid less cost-effective, more widely distributed, solutions, and to maintain a network structure for existing distributed facilities, e.g. for irradiation

**GSR 2 - Engineering support for detector R&D**

In response to ever more integrated detector concepts requiring holistic design approaches and large component counts, the R&D should be supported with adequate mechanical and **ASIC Design, advanced mechanics** in state-of-the-art microelectronics as well as advanced materials and manufacturing techniques, to tackle generic integration challenges, and to maintain scalability of production and quality control from the earliest stages.

**GSR 3 - Specific software for instrumentation**

Across DRDTs and through adequate capital investments, the availability to the community of state-of-the-art R&D-specific software packages must be maintained and continuously updated. The **GEANT4, Pandora, key4HEP** core software frameworks, but also for commonly used simulation and reconstruction tools - should continue to be highly recognised and valued and the community effort to support these needs to be organised at a European level.

**GSR 4 - International coordination and organisation of R&D activities**

With a view to creating a vibrant ecosystem for R&D, connecting and involving all partners, there is a need to refresh the CERN RD programme structure and encourage new programmes for next generation and the other national laboratories can assist as major catalysers for these. It is also recommended to revisit and **R&D collaborations** and reviewing these programmes, with an extended framework to help share the associated load and increase involvement, while enhancing the visibility of the detector R&D community and easing communication with neighbouring disciplines, for example in cooperation with the ICFA Instrumentation Panel.

### **GSR 5 - Distributed R&D activities with centralised facilities**

Establish in the relevant R&D areas a distributed yet connected and supportive tier-ed system for R&D efforts across Europe. Keeping in mind the growing complexity, the specialisation required, the learning curve and the increased cost, consider more focused investment for those themes where leverage can be reached through centralisation at large institutions, while addressing the challenge that distributed resources remain accessible to researchers across Europe and through them also be available to help provide enhanced training opportunities.

### **GSR 6 - Establish long-term strategic funding programmes**

Establish, additional to short-term funding programmes for the early proof of principle phase of R&D, also long-term strategic funding programmes to sustain both research and development of the multi-decade DRDTs in order for the technology to mature and to be able to deliver the experimental requirements. Beyond capital investments of single funding agencies, international collaboration and support at the EU level should be established. In general, the cost for R&D has increased, which further strengthens the vital need to make concerted investments.

### **GSR 7 – “Blue-sky” R&D**

It is essential that adequate resources be provided to support more speculative R&D which can be riskier in terms of immediate benefits but can bring significant and potentially transformational returns if successful both to particle physics: unlocking new physics may only be possible by unlocking novel technologies in instrumentation, and to society. Innovative instrumentation research is one of the defining characteristics of the field of particle physics. “Blue-sky” developments in particle physics have often been of broader application and had immense societal benefit. Examples include: the development of the World Wide Web, Magnetic Resonance Imaging, Positron Emission Tomography and X-ray imaging for photon science.

### GSR 5 - Distributed R&D activities with centralised facilities

Establish in the relevant R&D areas a distributed yet connected and supportive tier-ed system for R&D efforts across Europe. Keeping in mind the growing complexity, the specialisation and cost, consider more focused investment for those themes where leverage can be reached. **Distributed Detector Laboratory** While addressing the challenge that distributed resources remain accessible to researchers across Europe and through them also be available to help provide enhanced training opportunities.

### GSR 6 - Establish long-term strategic funding programmes

Establish, additional to short-term funding programmes for the early proof of principle phase of R&D, also long-term strategic funding programmes to sustain both research and development. **double the FTX budget!** It is in order for the technology to mature and to be able to deliver the experimental requirements. Beyond capital investments of single funding agencies, international collaboration and support at the EU level should be established. In general, the cost for R&D has increased, which further strengthens the vital need to make concerted investments.

### GSR 7 – “Blue-sky” R&D

It is essential that adequate resources be provided to support more speculative R&D which can be riskier in terms of immediate benefits but can bring significant and potentially transformational returns if successful both to particle physics: unlocking new physics may only be possible by unlocking novel technologies in **industry, neighbouring fields** instrumentation research is one of the defining characteristics of the field of particle physics. “Blue-sky” developments in particle physics have often been of broader application and had immense societal benefit. Examples include: the development of the World Wide Web, Magnetic Resonance Imaging, Positron Emission Tomography and X-ray imaging for photon science.

**GSR 8 - Attract, nurture, recognise and sustain the careers of R&D experts**

Innovation in instrumentation is essential to make progress in particle physics, and R&D experts are essential for innovation. It is recommended that ECFA, with the involvement and support of its Detector R&D Panel, continues the study of recognition with a view to consolidate the route to an adequate number of positions with a sustained career in instrumentation R&D to realise the strategic aspirations expressed in the EPPSU. It is suggested that ECFA should explore mechanisms to develop concrete proposals in this area and to find mechanisms to follow up on these in terms of their implementation. Consideration needs to be given to creating sufficiently attractive remuneration packages to retain those with key skills which typically command much higher salaries outside academic research. It should be emphasised that, in parallel, society benefits from the training particle physics provides because the knowledge and skills acquired are in high demand by industries in high-technology economies.

**GSR 9 - Industrial partnerships**

It is recommended to identify promising areas for close collaboration between academic and industrial partners, to create international frameworks for exchange on academic and industrial trends, drivers and needs, and to establish strategic and resources-loaded cooperation schemes on a European scale to intensify the collaboration with industry, in particular for developments in solid state sensors and micro-electronics.

**GSR 10 – Open Science**

It is recommended that the concept of Open Science be explicitly supported in the context of instrumentation, taking account of the constraints of commercial confidentiality where these apply due to partnerships with industry. Specifically, for publicly-funded research the default, wherever possible, should be open access publication of results and it is proposed that the Sponsoring Consortium for Open Access Publishing in Particle Physics (SCOAP<sup>3</sup>) should explore ensuring similar access is available to instrumentation journals (including for conference proceedings) as to other particle physics publications.

### GSR 8 - Attract, nurture, recognise and sustain the careers of R&D experts

Innovation in instrumentation is essential to make progress in particle physics, and R&D experts are essential for innovation. It is recommended that ECFA, with the involvement and support of its Detector R&D Panel, continues the study of recognition with a view to consolidate the route to an adequate number of career in instrumentation R&D to realise the strategic aspirations expressed in the EPPSU. It is suggested that ECFA should develop concrete proposals in this area and to find mechanisms to follow up on these in terms of their implementation. Consideration needs to be given to creating sufficiently attractive remuneration packages to retain those with key skills which typically command much higher salaries outside academic research. It should be emphasised that, in parallel, society benefits from the training particle physics provides because the knowledge and skills acquired are in high demand by industries in high-technology economies.

Recruiting, salaries

### GSR 9 - Industrial partnerships

It is recommended to identify promising areas for close collaboration between academic and industrial partners, to create international frameworks for exchange on academic and industrial trends, and to establish strategic and resources-loaded cooperation schemes on a European scale to intensify the collaboration with industry, in particular for developments in solid state sensors and micro-electronics.

Innovation

### GSR 10 – Open Science

It is recommended that the concept of Open Science be explicitly supported in the context of instrumentation, taking account of the constraints of commercial confidentiality with industry. Specifically, for publicly-funded research the default, wherever possible, should be open access. It is proposed that the Sponsoring Consortium for Open Access Publishing in Particle Physics (SCOAP<sup>3</sup>) should explore ensuring similar access is available to instrumentation journals (including for conference proceedings) as to other particle physics publications.

Open Access publications

- **The detector roadmap depicts a rich landscape of connected R&D activities**
- **It exhibits synergies between parallel activities targeted at different future projects at different facilities**
- **Opportunities appear where near-term projects with less demanding conditions may serve as stepping stones for a strategic R&D targeting more aggressive requirements**
- **General strategic recommendations capture the needs of an evolving field with central importance for our future ambitions**

# Implementation

# Next Steps: Implementation Plan

---

In its December meeting, CERN Council has mandated ECFA to work out a plan

*“The Council further took note of the report by the Scientific Policy Committee Chair, Professor Rivkin, on the SPC’s positive response to the roadmaps [Accelerator and Detector R&D] at its September and December meetings, and of the statements by delegations voicing support for the content of the documents and expressing appreciation to ECFA, the LDG and all the members of the respective communities who had contributed to the preparation of the roadmaps.*”

*The Council agreed to invite ECFA and the LDG to elaborate, in close collaboration with the SPC, the funding agencies and the relevant research organisations in Europe and beyond, detailed **implementation plans** setting out milestones, priorities and funding sources, for consideration by the Council at its Session in March 2022.”*

Consensus that momentum must be kept and a plan be put in place as early as possible

# Next Steps: Implementation Plan

---

- ECFA Roadmap Coordination group has been entrusted to work out the implementation plan

Coordination Group: Phil Allport, Silvia Dalla Torre, Jorgen D'Hondt, Karl Jakobs,  
Manfred Krammer, Susanne Kühn, Felix Sefkow and Ian Shipsey

- To be iterated with Restricted ECFA
- Discussions with Funding Agencies are planned (together with LDG) before March Council week
- First presentation and discussion in March Council

It may be possible that important detector R&D activities can be embedded in the defined Detector R&D Themes (DRDTs) of the ECFA Detector R&D Roadmap and in the emerging structures set up during the implementation process

# Conclusions

**Requested by the EPPSU, ECFA set up a Roadmap process with broad community consultation**

- Ensure that detector development with its long time scales does not become the limiting factor for the future projects envisaged by the European Strategy

**A matrix structure is laid out, displaying synergies between concurrent and subsequent projects**

- complemented by general strategic recommendations to strengthen the field

**Discussions towards the implementation are on-going**

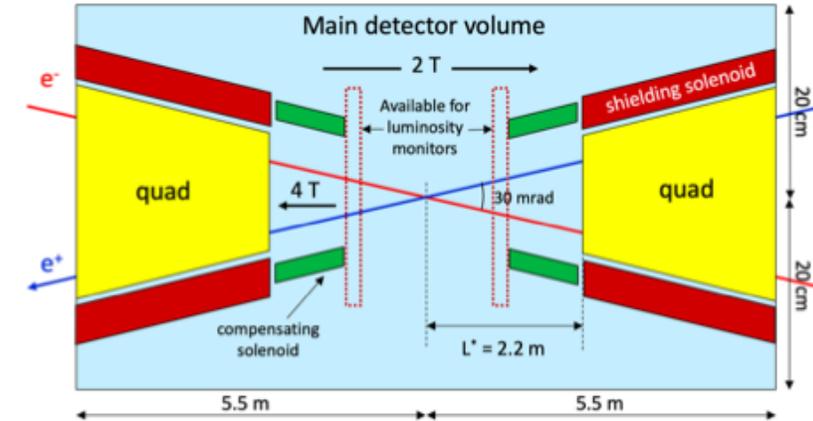

- R&D collaborations and review processes will be important ingredients for success

**The roadmap should be updated together with the European Strategy**

# Back-up

- ◆ 30 mrad beam crossing angle
  - Detector B-field limited to 2 Tesla at Z-peak operation
  - Very complex and tightly packed MDI (Machine Detector Interface)
- ◆ "Continuous" beams (no bunch trains); bunch spacing down to 20 ns
  - Power management and cooling (no power pulsing)
- ◆ Extremely high luminosities
  - High statistical precision – control of systematics down to  $10^{-5}$  level
  - Online and offline handling of  $\mathcal{O}(10^{13})$  events for precision physics: "Big Data"
- ◆ Physics events at up to 100 kHz
  - Fast detector response ( $\lesssim 1 \mu\text{s}$ ) to minimise dead-time and event overlaps (pile-up)
  - Strong requirements on sub-detector front-end electronics and DAQ systems
    - ❖ At the same time, keep low material budget: minimise mass of electronics, cables, cooling, ...
- ◆ More physics challenges
  - Luminosity measurement to  $10^{-4}$  – luminometer acceptance to  $1 \mu\text{m}$  level
  - Detector acceptance to  $\sim 10^{-5}$  – acceptance definition to few 10s of  $\mu\text{m}$ , hermeticity (no cracks!)
  - Stability of momentum measurement – stability of magnetic field wrt  $E_{\text{cm}}$  ( $10^{-6}$ )
  - Impact parameters, detached vertices – Higgs physics (b/c/g jets); flavour and  $\tau$  physics, life-time measurements
  - Particle identification ( $\pi/K/p$ ) without ruining detector hermeticity – flavour and  $\tau$  physics (and rare processes)

Central part of detector volume – top view

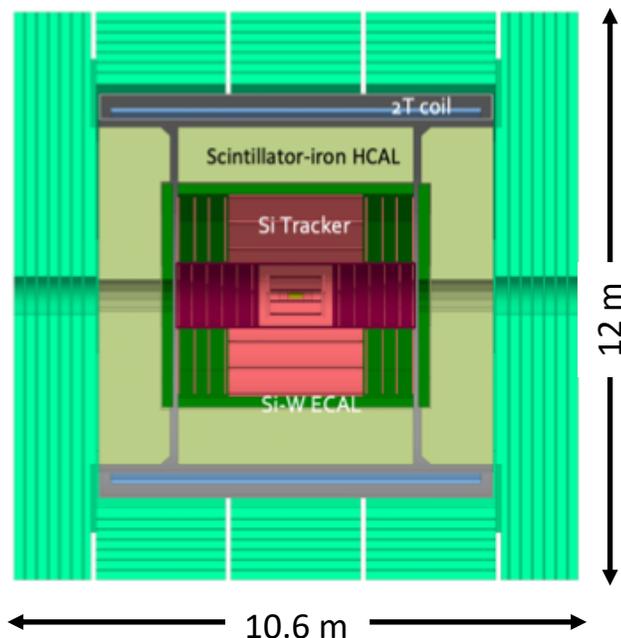

# CDR: Two Complementary Detector Concepts

"Proof of principle concepts"

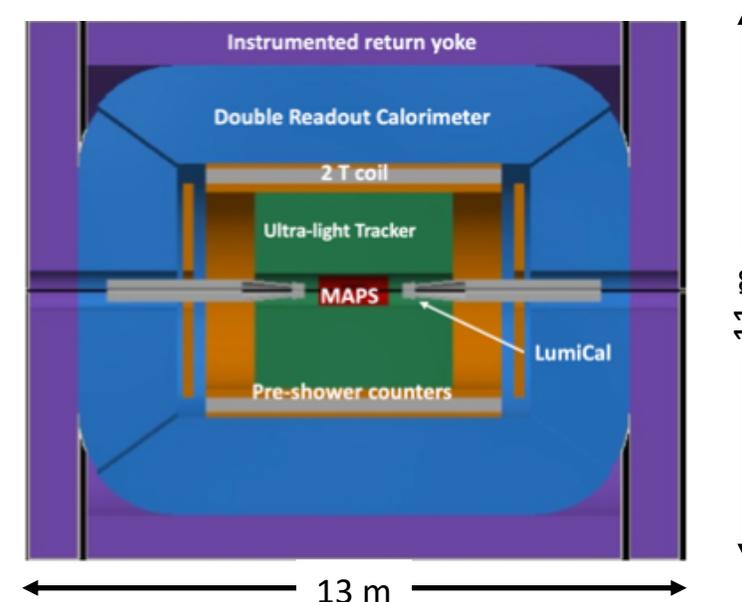

- Not necessarily matching (all) detector requirements, which are still being spelled out

CLD

- ◆ Based on CLIC detector design; profits from technology developments carried out for LCs (c.f. F.Simon's talk)
  - All silicon vertex detector and tracker
  - 3D-imaging highly-granular calorimeter system
  - Coil *outside* calorimeter system

IDEA

- ◆ New, innovative, possibly more cost-effective concept
  - Silicon vertex detector
  - Short-drift, ultra-light wire chamber
  - Dual-readout calorimeter
  - Thin and light solenoid coil *inside* calorimeter system

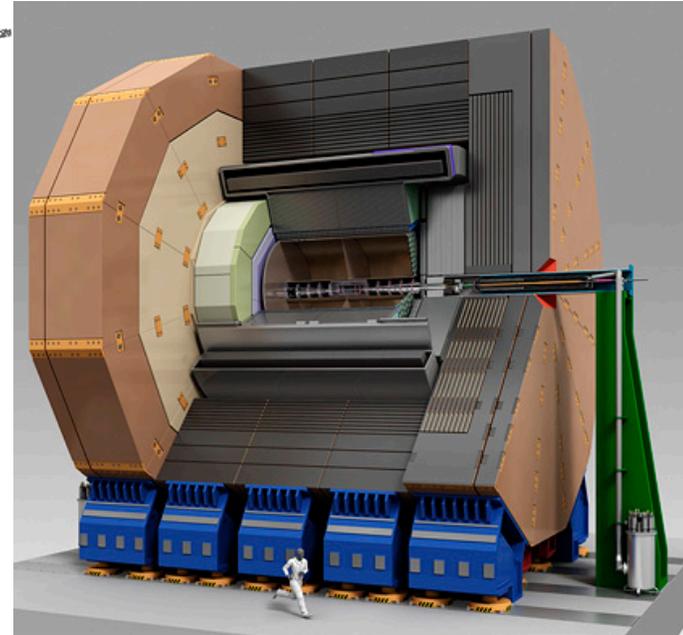

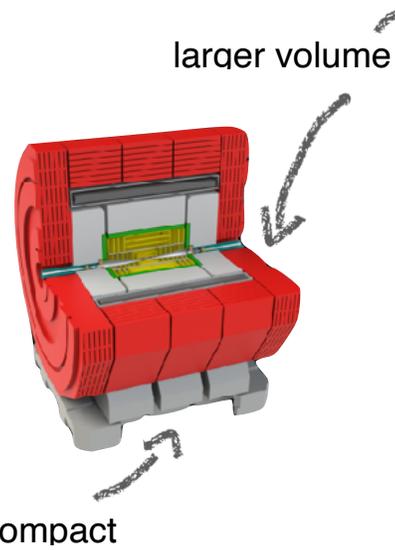

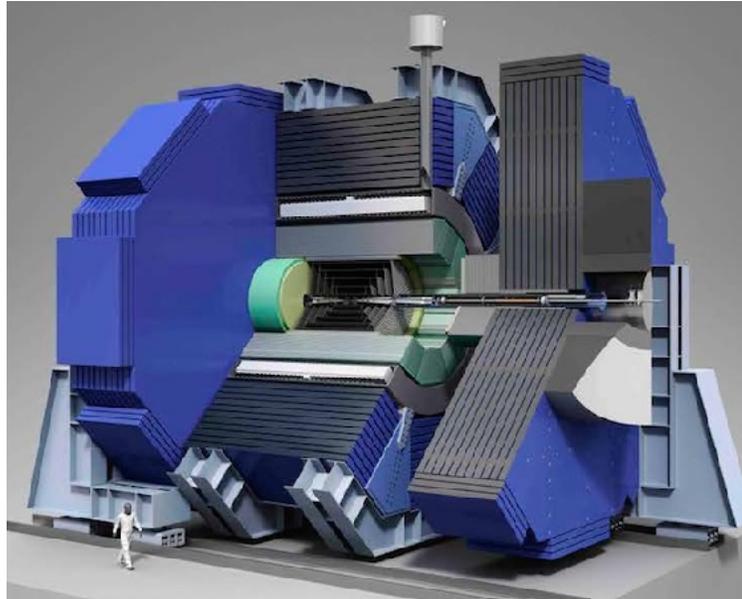

<https://arxiv.org/abs/1911.12230>, <https://arxiv.org/abs/1905.02520>

<https://pos.sissa.it/390/>

# CLICdet: The Best of ILD and SID Worlds

## Particle-flow Driven Detector Concepts

- Two detector concepts for ILC: SiD, ILD - with somewhat different optimisation

For ILD: 2 versions  
(large / small)  
under study

5T field

all-Si tracker with outer radius of 1.2 m

VTX inner radius 14 mm

4.5  $\lambda_I$  HCAL

- 3.5T / 4T field

- TPC as main tracker, supplemented by outer Si envelope  
radius 1.77 m / 1.43 m

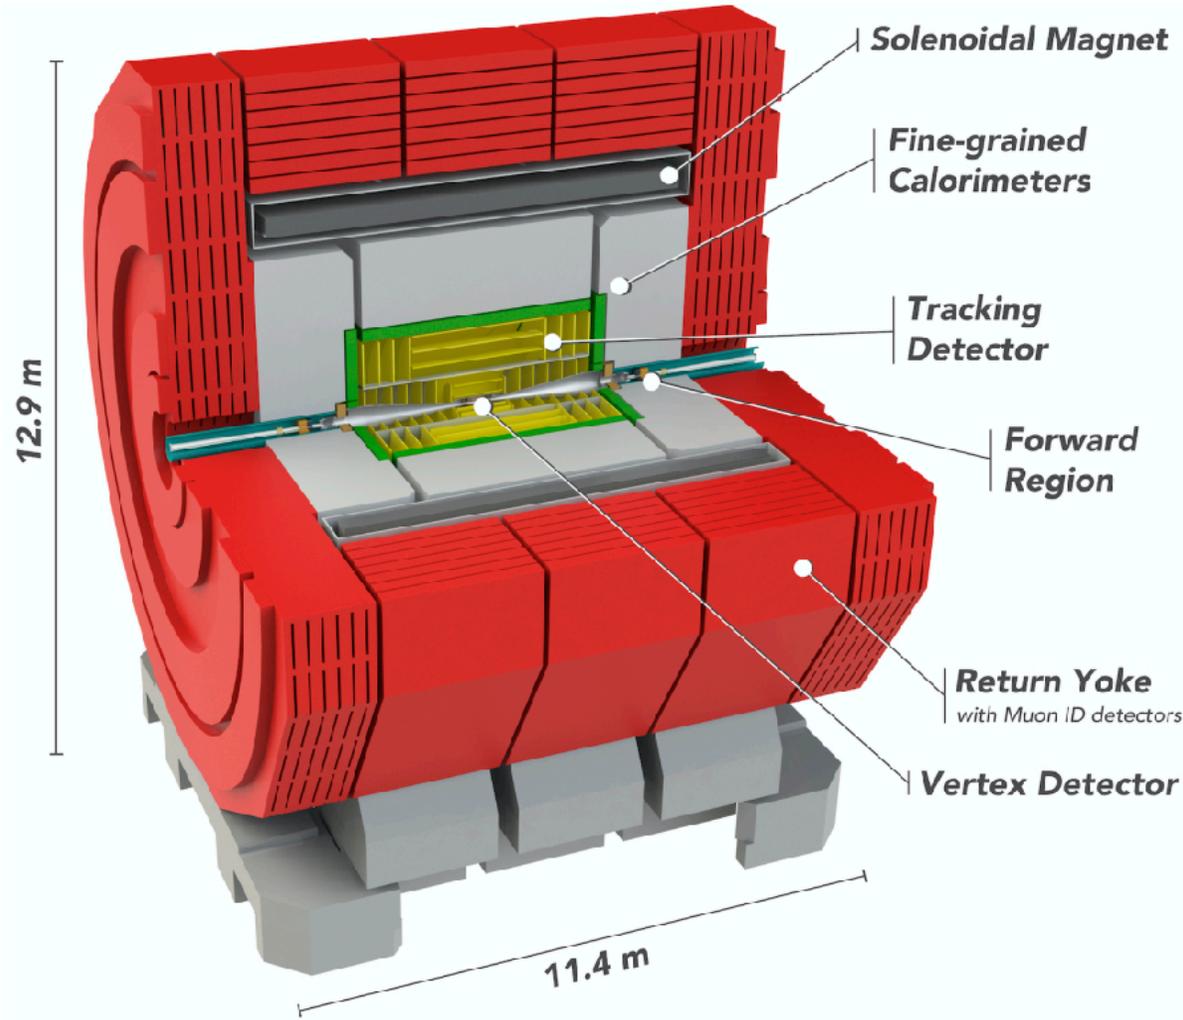

- VTX inner radius 16 mm

- 6  $\lambda_I$  HCAL

Frank Simon

# CLICdet: The Best of ILD and SID Worlds

## Particle-flow Driven Detector Concepts

- A **4T solenoid**, enclosing calorimeters and tracking
- **All-silicon tracker**, with 1 - 2%  $X_0$  / layer, 1.5 m radius, 7  $\mu\text{m}$  single point resolution
- **Vertex detector**, with 3 double layers in barrel, 31 mm inner radius, 0.2%  $X_0$  per layer, 25  $\mu\text{m}$  pixels, 3  $\mu\text{m}$  single point resolution, forced air cooling
- **Highly granular calorimeters**: 40 layers SiW ECAL (22  $X_0$ ), 60 layers Scint/Steel HCAL (7.5  $\lambda_I$  + 1  $\lambda_I$  in ECAL)

# Highly Granular Liquid Argon Calorimeters

## For Example

Originally started with FCChh in mind

Following recent advances on advanced materials for thin cryostats also studied for FCCee

- both cryostat and high granularity are critical R&D directions

**Both warm and cold electronics considered**

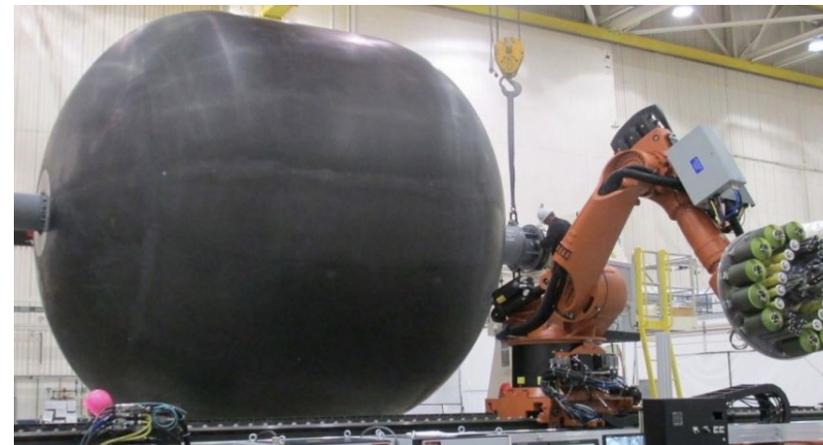

- high-density feedthroughs
- heat management of embedded FE chips
- MIP sensitivity in reach

**High-tech development**

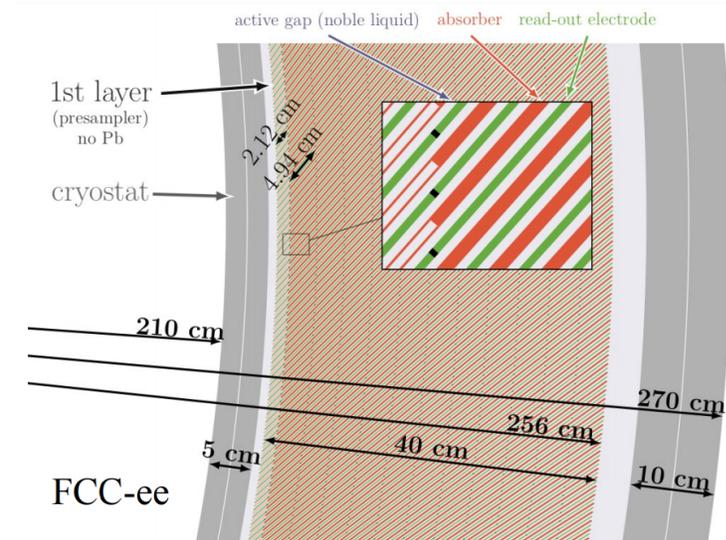

- and room for ideas, e.g. optical readout with UV-sensitive SiPMs
- synergies with other noble liquid detectors

**See talk by N. Morange tomorrow**

- still need to build a Detector Concept around LAr Calo

NASA's lineless cryotank

## AIDAinnova focusses on Strategic R&D in the pre-TDR phase

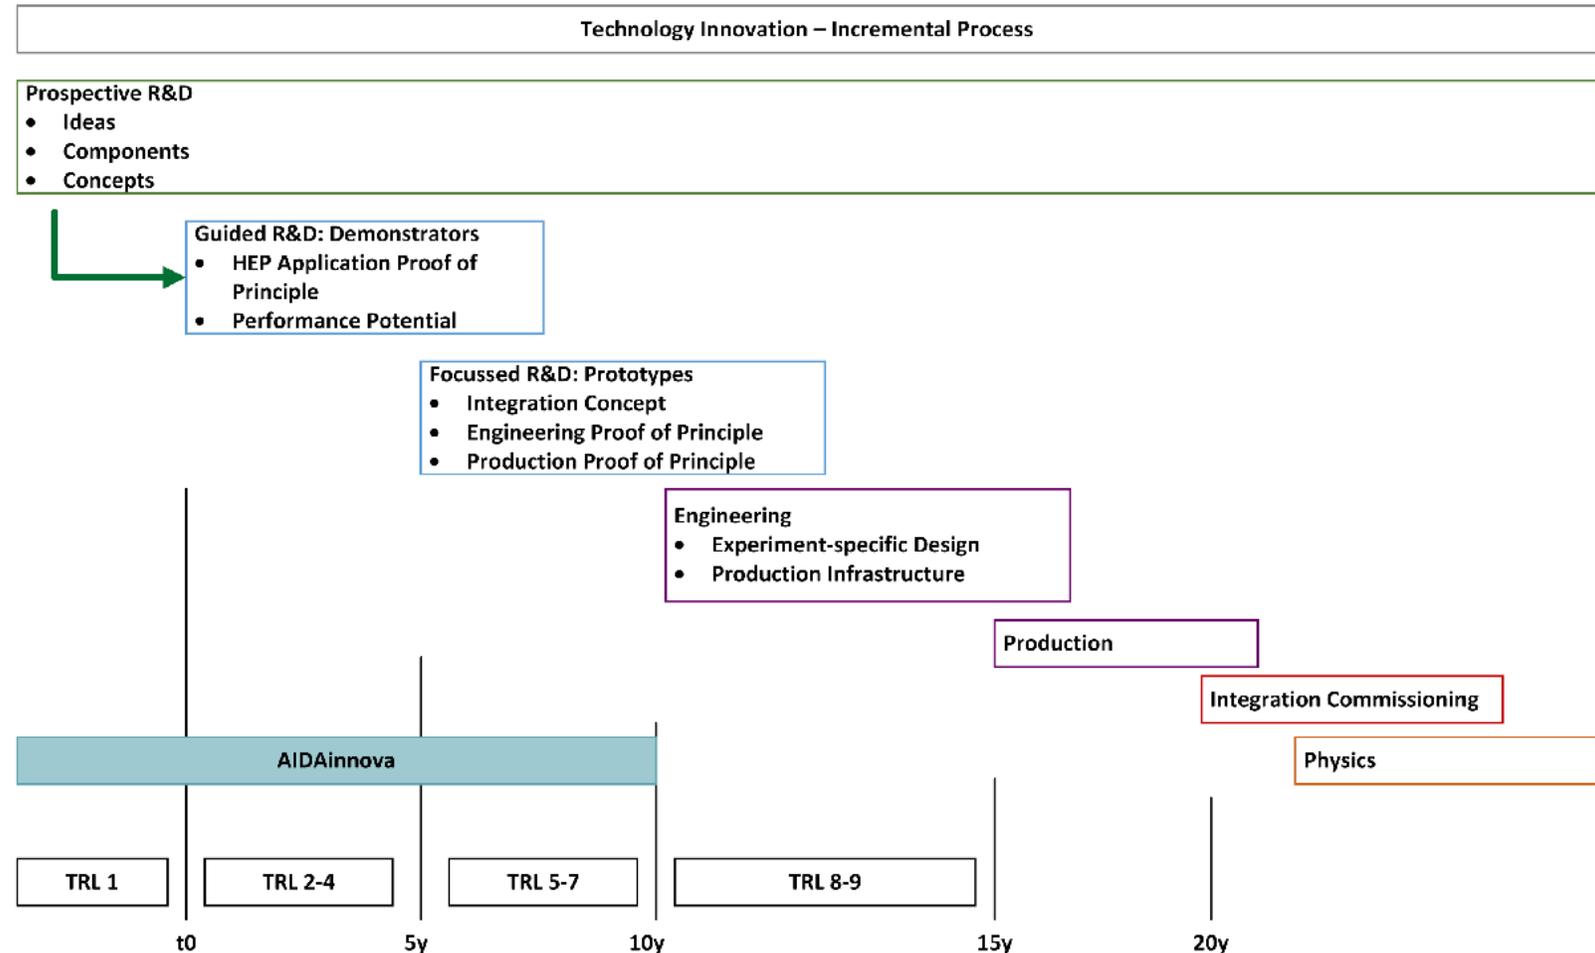

- Technology Readiness Levels 2-7
- Not yet experiment-specific: potential to unfold synergies

## Include some prospective R&D

- competitive call at start of project
- “Blue Sky”, quantum sensors,...

## Targeted applications

- Higgs Factories
- ALICE, LHCb LS3 pre-TDR, ATLAS & CMS LS4
- Accelerator-based neutrino experiments
- and others

49% is “generic”, beneficial for all future projects:

- Testbeam and facility upgrades
- Mechanics and cooling, Software
- “Blue Sky” R&D plus some tasks in other WP

51% can be associated with 1 to 3 projects

- “Matrix” to be taken with a grain of salt...
- Sharing will influence generic part, too
- Higgs factory detectors have largest share
