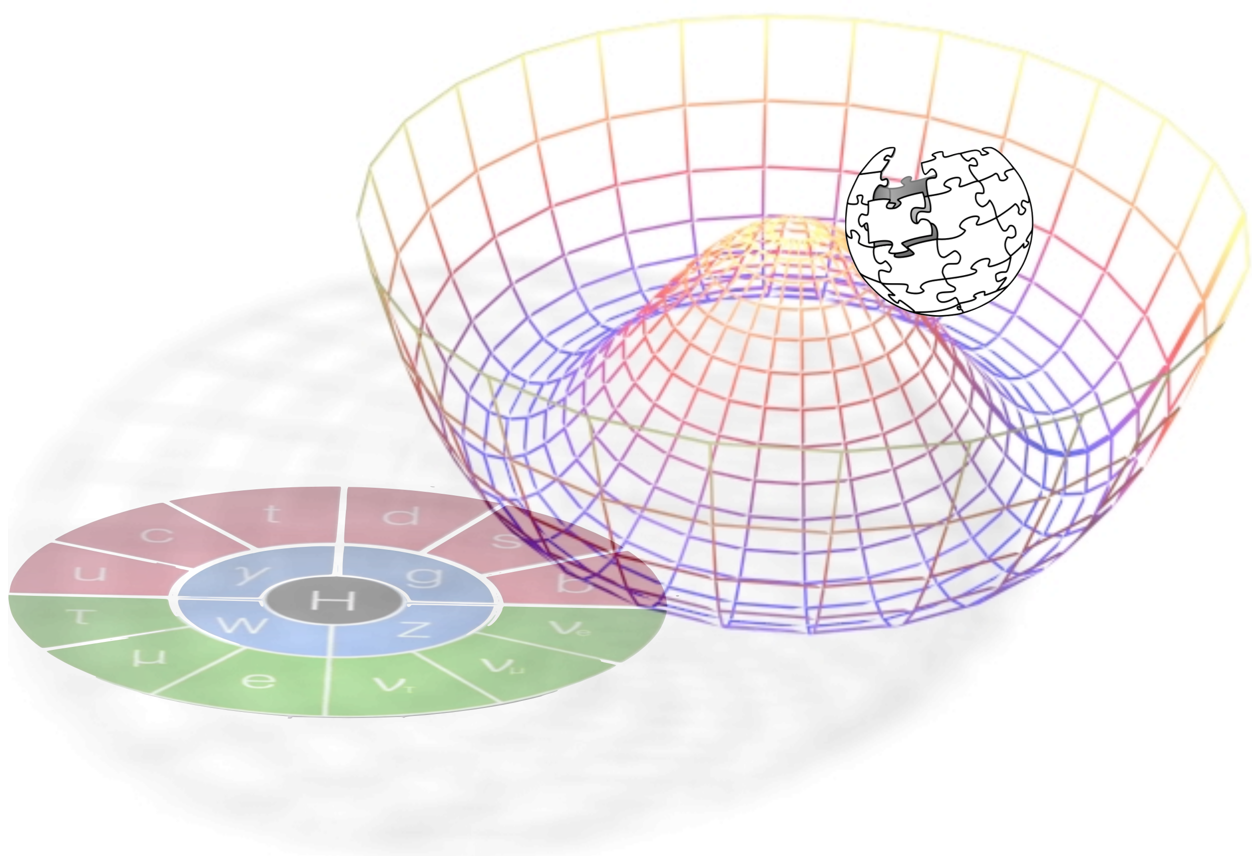
BSM landscape

after the Higgs discovery

DESY Seminar

Hamburg&Zeuthen, April 4&5, 2017



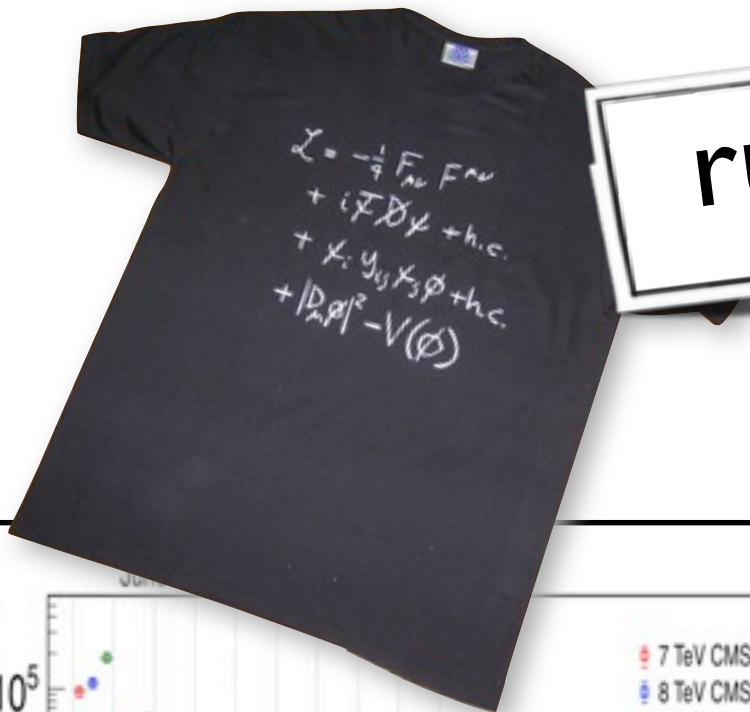
Christophe Grojean

DESY (Hamburg)

Humboldt University (Berlin)

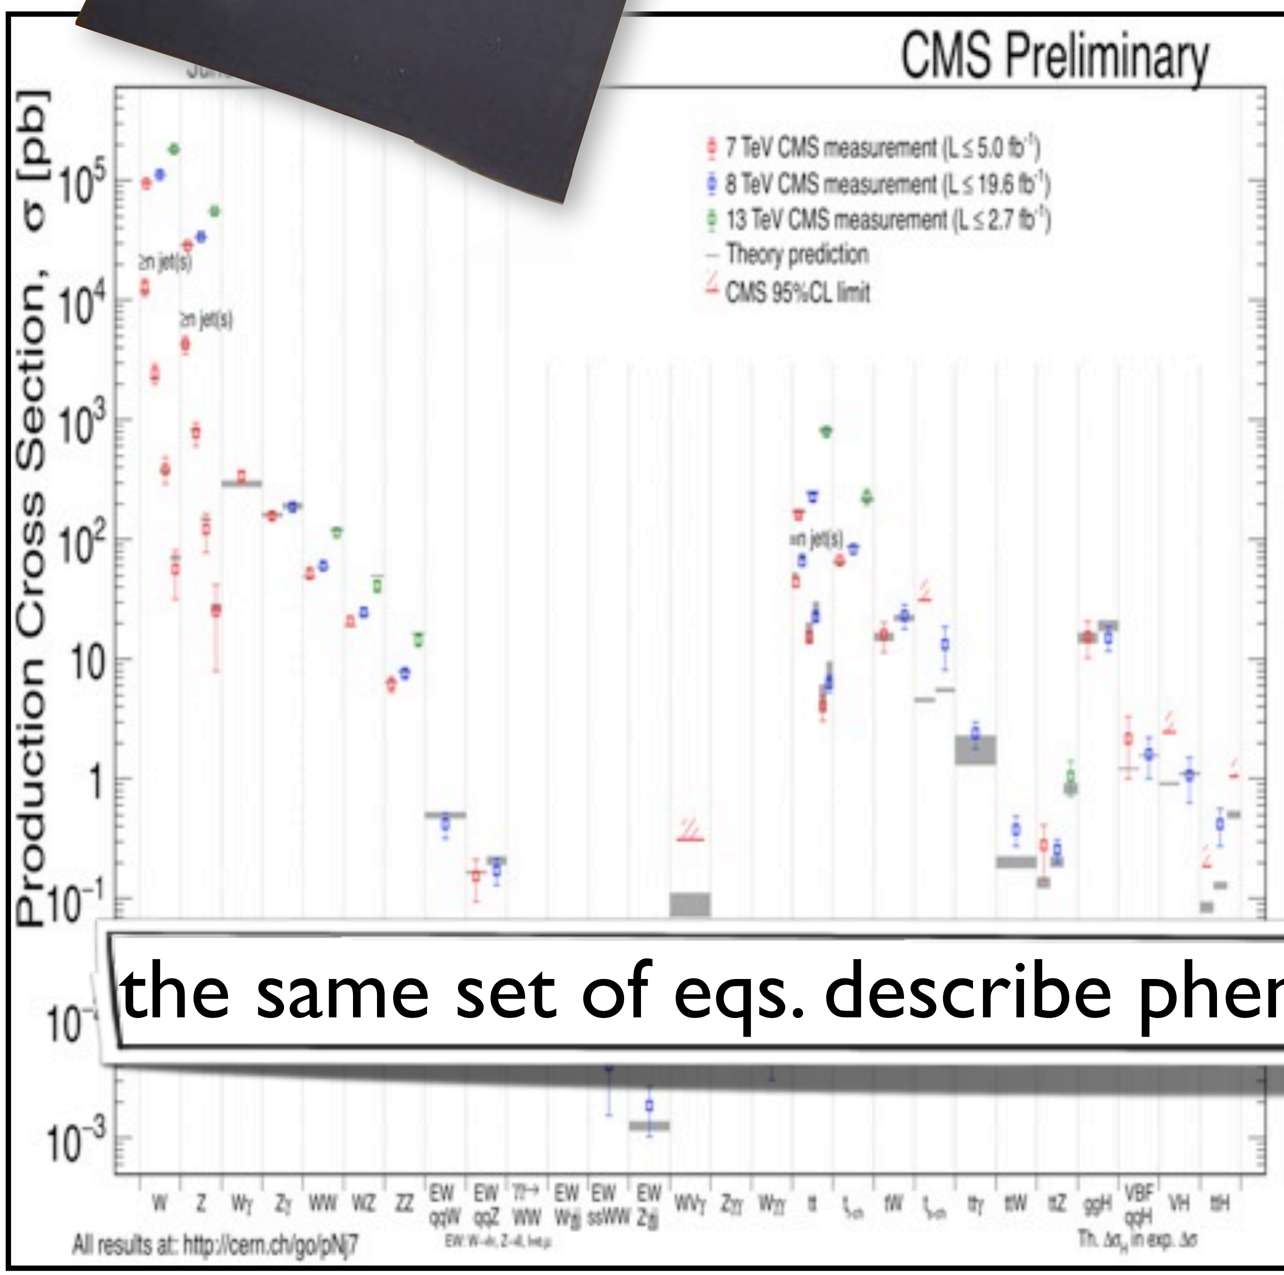
(christophe.grojean@desy.de)

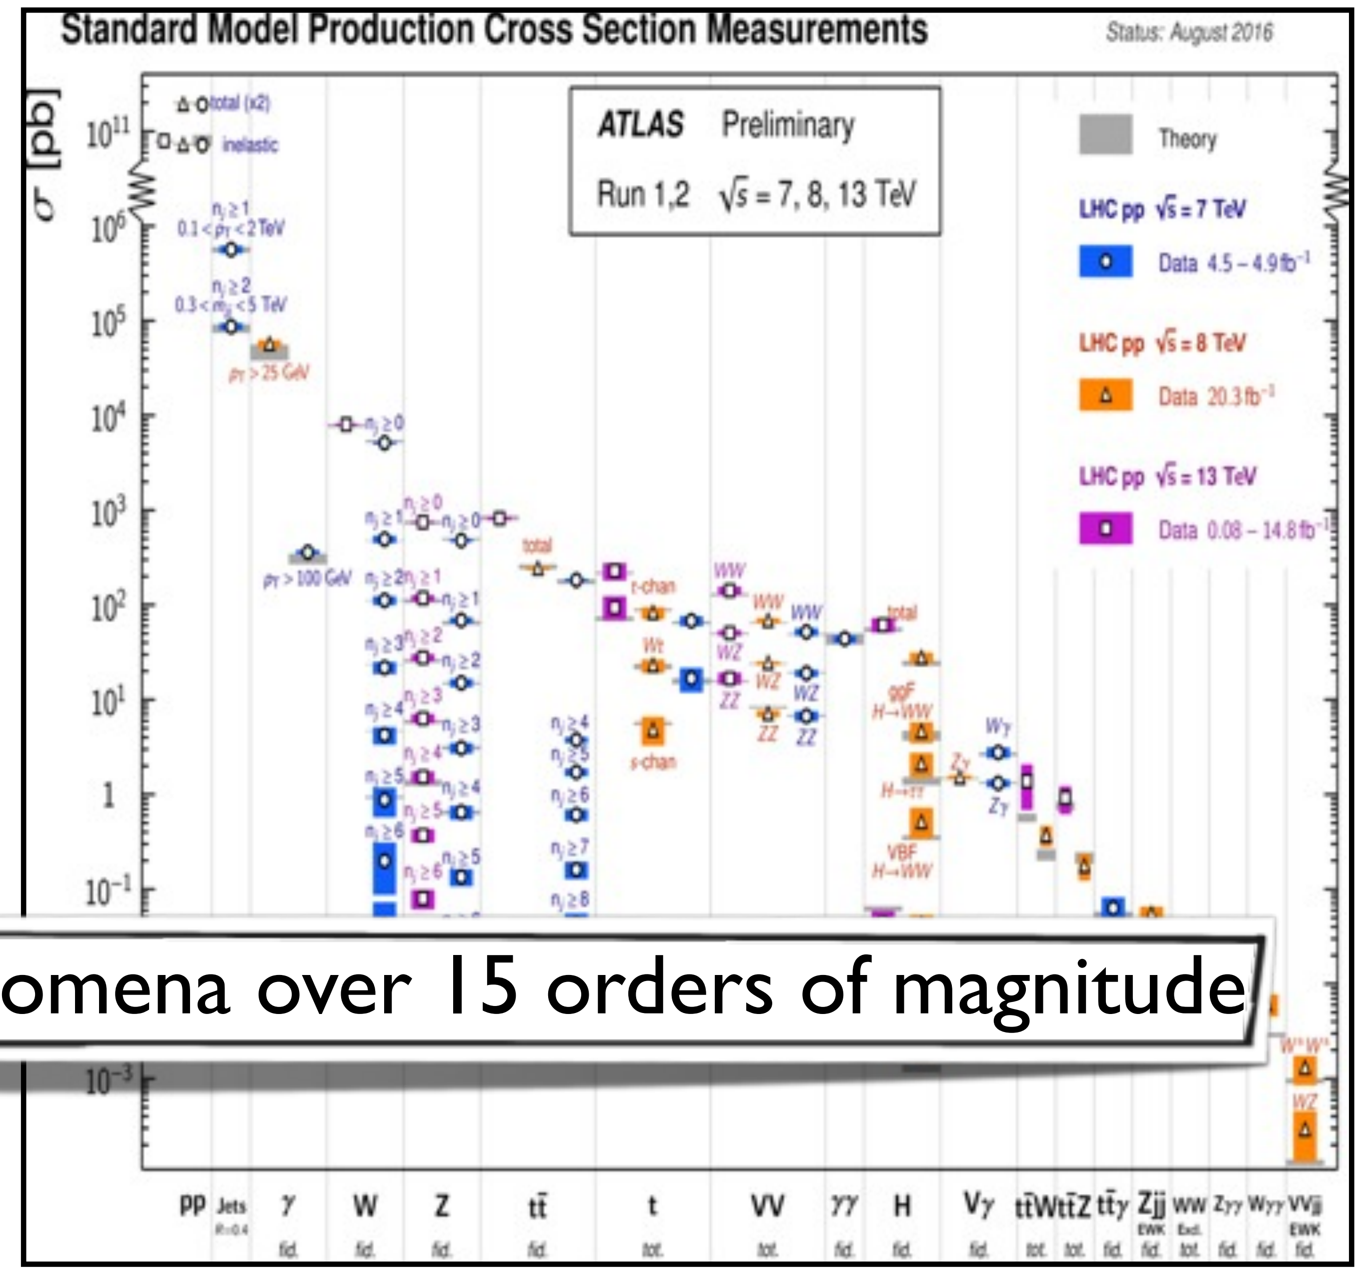
The SM and... the LHC data so far



rules the world!

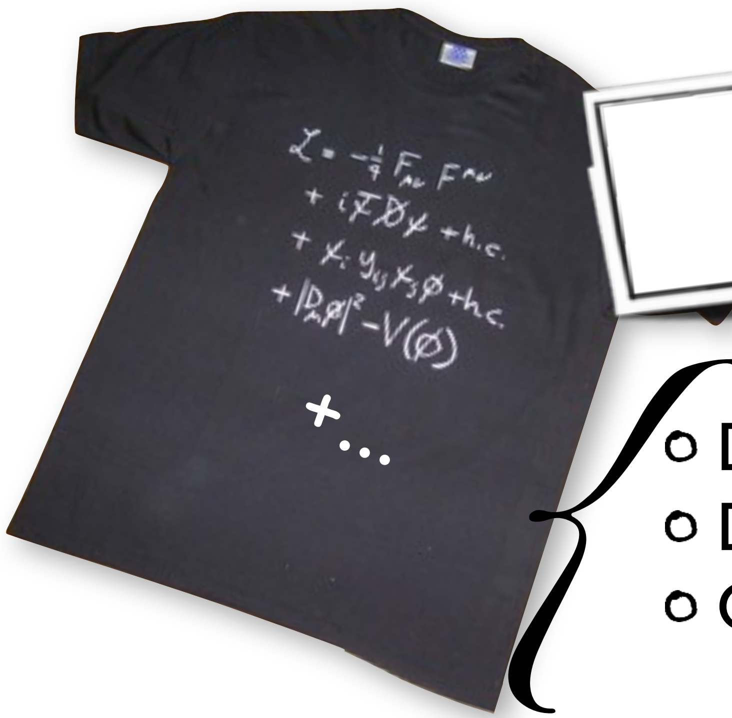
[and we, HEP practitioners, are all entitled for some royalties!]





the same set of eqs. describe phenomena over 15 orders of magnitude

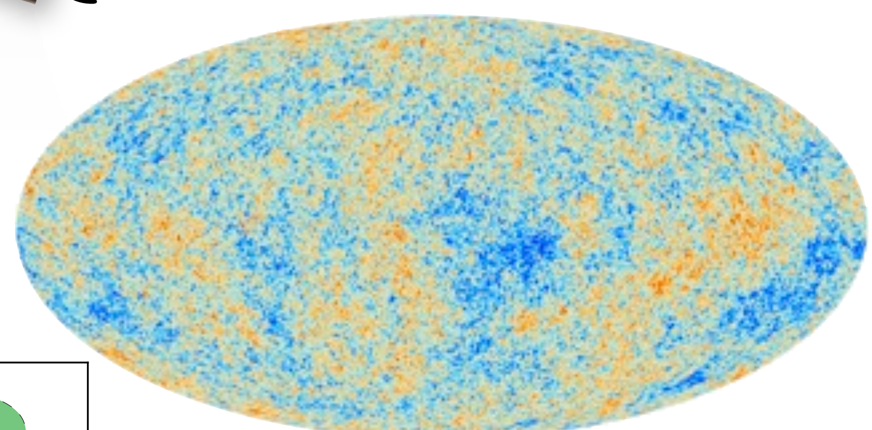
The SM and... the rest of the Universe

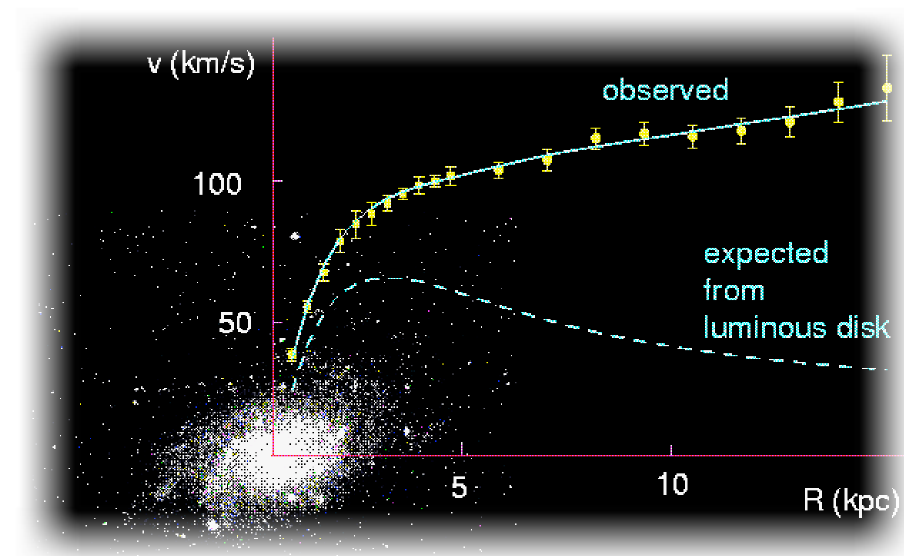


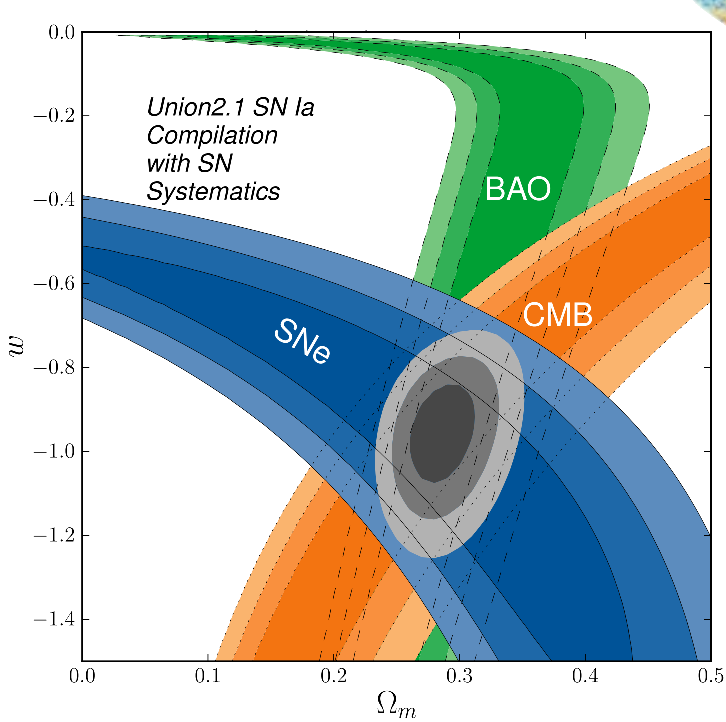
is not enough

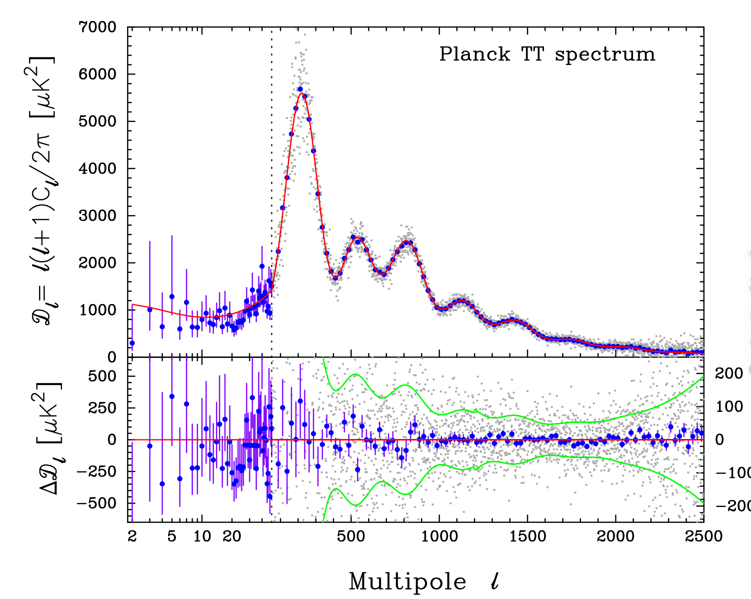
[and we all have to return our royalties!]

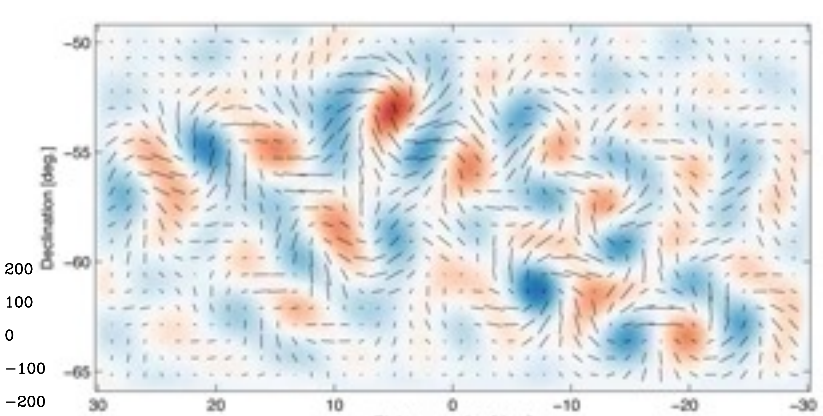
- Dark Matter
- Dark Energy
- Quantum gravity



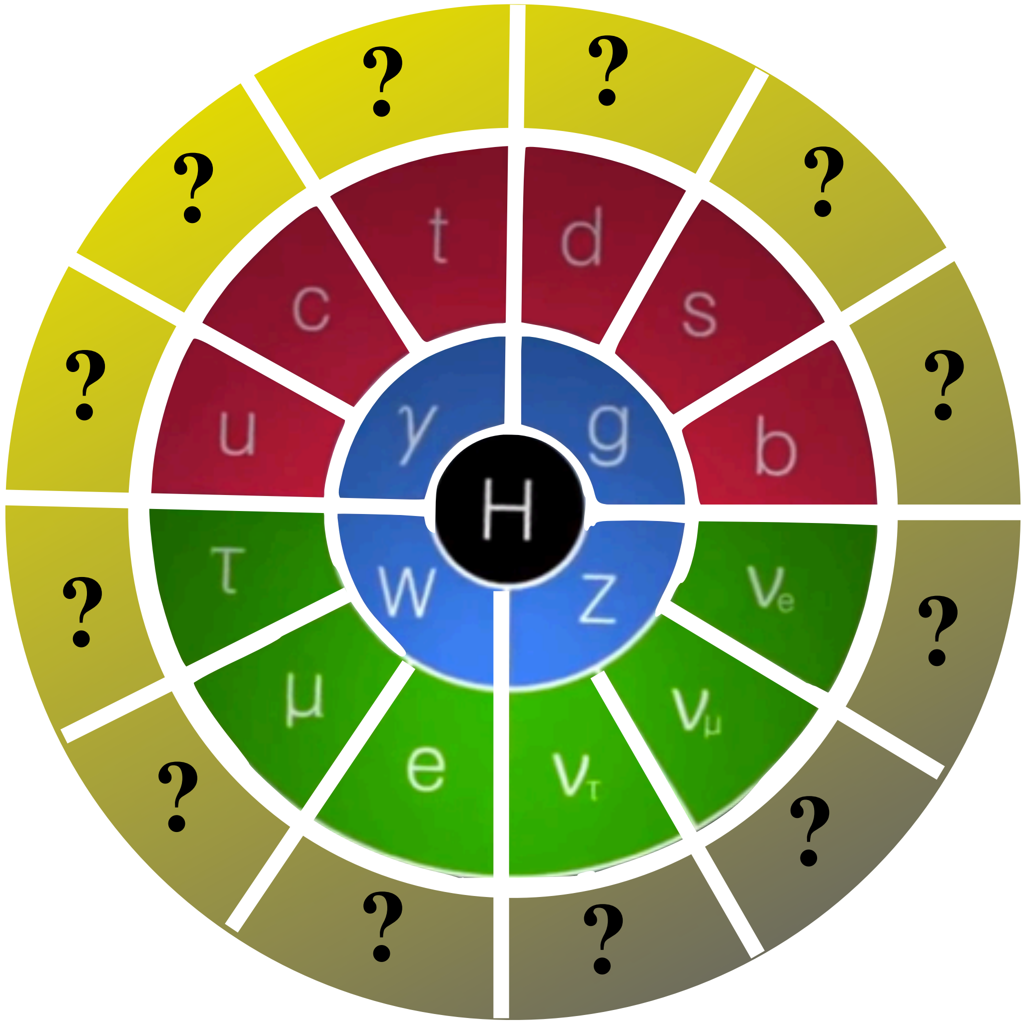








What is physics beyond the Standard Model?



I don't know. Nobody knows [If it were known, it would be part of the SM!]

Many evidences that BSM exist

We just don't know what it is

We have plenty of good ideas and there are rich opportunities

But no guarantee we are on the right track

We should stay open-minded and also learn from our failures

" Looking and not finding is different than not looking"

Sailing to the West with the right tool...

Once upon a time...

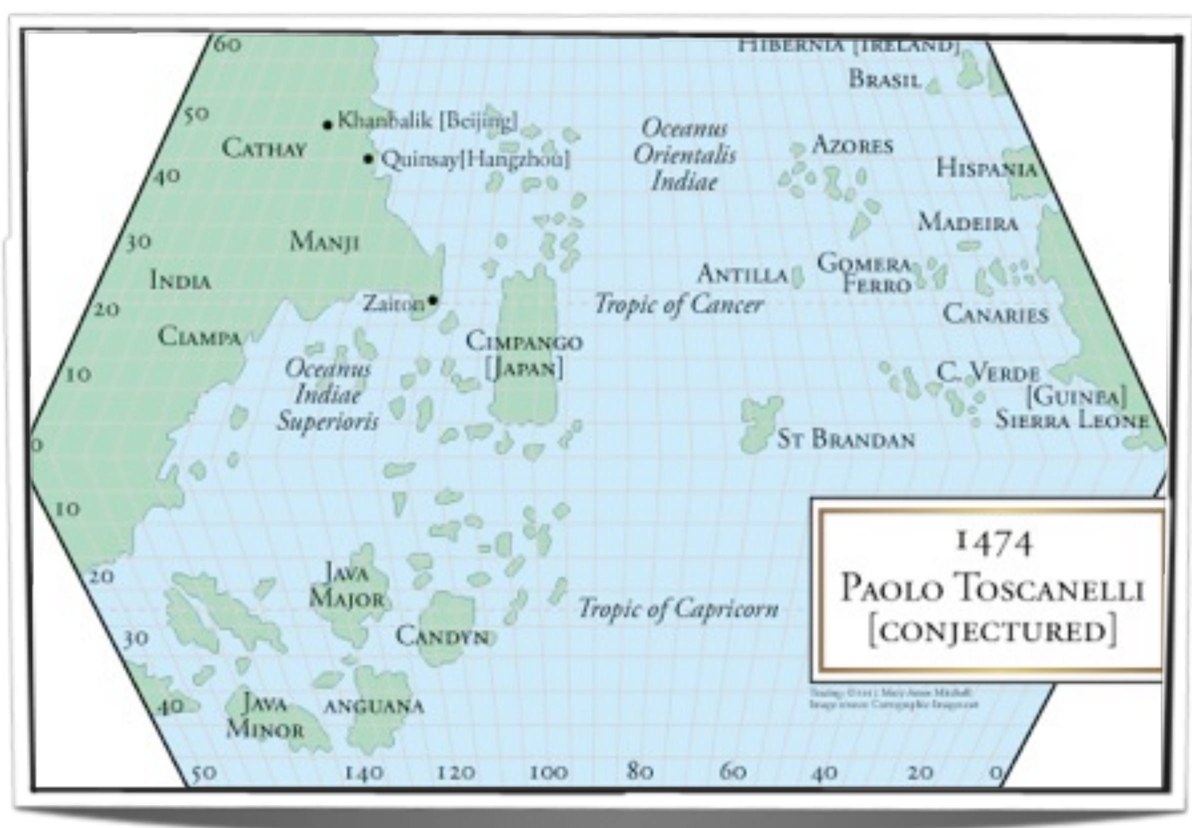
Columbus had a great proposal: "reaching India by sailing from the West"

He had a theoretical model

- the Earth is round,
- Eratosthenes of Cyrene first estimated its circumference to be 250'000 stadia
- other measurements later found smaller values ☞Toscanelli's map
- lost in unit-conversion or misled by post-truth statements, Columbus thought it was only 70'000 stadia, so he believed he could reach India in 4 weeks

He had the right technology

- Caravels were the only ships at that time to sail against the wind, necessary tool to fight the prevailing winds, aka Alizée.



Sailing to the West with the right tool...

Once upon a time...

Columbus had a great proposal: "reaching India by sailing from the West"

He had a theoretical model

- the Earth is round,
- Eratosthenes of Cyrene first estimated its circumference to be 250'000 stadia
- other measurements later found smaller values ☞Toscanelli's map
- lost in unit-conversion or misled by post-truth statements, Columbus thought it was only 70'000 stadia, so he believed he could reach India in 4 weeks

He had the right technology

- Caravels were the only ships at that time to sail against the wind, necessary tool to fight the prevailing winds, aka Alizée.

His proposal was scientifically rejected twice (by Portuguese's & Salamanca U.)
by the decision was overruled by Isabel ... and America became great (already)

Moral(s)

"if your proposal is rejected, submit it again" J. Mnich

"you need the right technology to beat your competitors" J. Fuster

"theorists don't need to be right!
but progress needs theoretical models to motivate exploration"

High Energy Physics with a Higgs boson

" With great power comes great responsibility "

Voltaire & Spider-Man

which, in physics, really means

" With great discoveries come great measurements "

HEP physicist desperately looking for anomalies
and writing a grant proposal
(true credit: F. Maltoni)

I will take the Higgs boson as an example
but similar story might be made for neutrinos, gravitational waves...

How did the Higgs discovery change BSM landscape?

High Energy Physics with a Higgs boson

The successes have been breathtaking

- in 4 years, the Higgs mass has been measured to 0.2% (vs 0.5% for the 20-year old top)
- some of its couplings, e.g. κ_γ, have been measured with 1-loop sensitivity (as EW physics at LEP)

The meaning of the Higgs

Particle physics is not so much about particles but more about fundamental principles

- About 10^{-10}s after the Big Bang, the Universe filled with the Higgs substance because it saved energy by doing so:

"the vacuum is not empty"

(even when $\hbar \to 0$, not a Casimir effect)

- The masses are **emergent** quantities due to a non-trivial **vacuum** structure
- There are only a **finite number** of particles (the SM ones) that acquire their mass via the Higgs vev
- There exists a **new type** (non-gauged) of fundamental **forces**: matter-dependent forces ($e \neq \mu$), e.g. familon, relaxion, Higgs portals...

High Energy Physics with a Higgs boson

The successes have been breathtaking

- in 4 years, the Higgs mass has been measured to 0.2% (vs 0.5% for the 20-year old top)
- some of its couplings, e.g. κ_γ, have been measured with 1-loop sensitivity (as EW physics at LEP)

Higgs agenda for the LHC-II, HL-LHC, ILC/CLIC, FCC, CepC, SppC, SHiP

multiple independent, synergetic and complementary approaches to achieve **precision** (couplings), **sensitivity** (rare and forbidden decays) and **perspective** (role of Higgs dynamics in broad issues like EWSB and vacuum stability, baryogenesis, inflation, naturalness, etc)

M.L. Mangano, Washington '15

- rare Higgs decays: $h\to\mu\mu$, $h\to\gamma Z$
- Higgs flavor violating couplings: $h\to\mu\tau$ and $t\to hc$
- Higgs CP violating couplings
- exclusive Higgs decays (e.g. $h\to J/\Psi+\gamma$) and measurement of couplings to light quarks
- exotic Higgs decay channels:

  $h\to \not{E}_T$, $h\to 4b$, $h\to 2b2\mu$, $h\to 4\tau, 2\tau 2\mu$, $h\to 4j$, $h\to 2\gamma 2j$, $h\to 4\gamma$, $h\to \gamma/2\gamma + \not{E}_T$,

  $h\to$isolated leptons+ $\not{E}_T$, $h\to 2l+ \not{E}_T$, $h\to$one/two lepton-jet(s)+X, $h\to bb+ \not{E}_T$, $h\to \tau\tau+ \not{E}_T$ ...
- searches for extended Higgs sectors (H, A, $H^\pm$, $H^{\pm\pm}$...)
- Higgs self-coupling(s)
- Higgs width
- Higgs/axion coupling?
- ...

1

Higgs Portrait

Higgs physics vs BSM

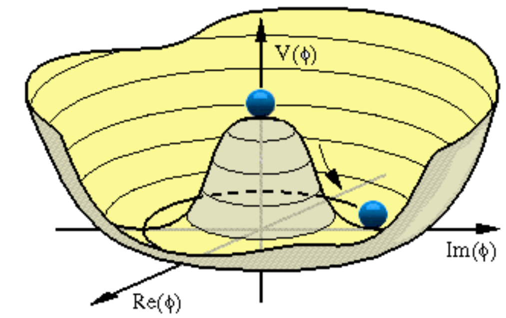
(courtesy of A. Pomarol@Moriond2014)

Several deformations away from the SM affecting Higgs properties are already probed in the vacuum

(assuming EW symmetry linearly realized and that new physics is heavy)

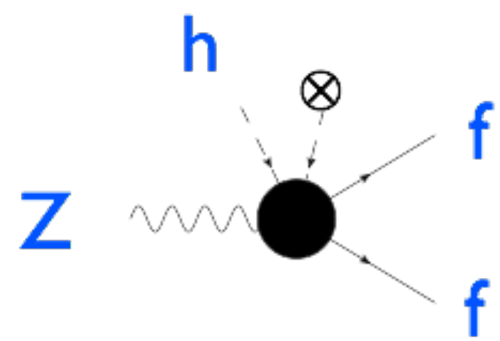
ϕ = v+h

→ vacuum

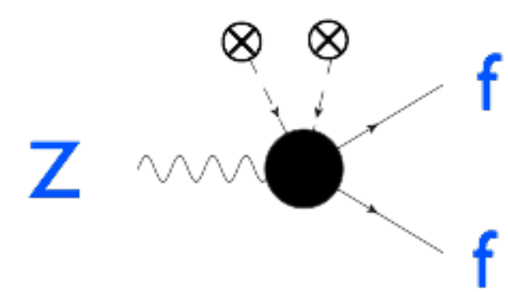


Potentially new BSM-effects in h physics could have been already tested in the vacuum

e.g.



$$= \frac{1}{2v} \times$$



$$H^\dagger D_\mu H \bar{f} \gamma^\mu f$$

(assuming that the Higgs boson is part of a doublet)

Modifications in h→Zff related to Z→ff

One can use h→ZZ→4l to probe this deformation but hard time to compete with LEP bounds

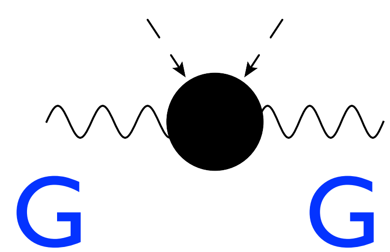
consistency check not discovery mode

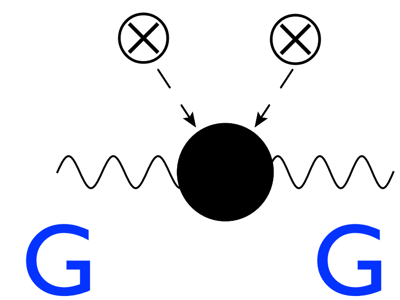
Higgs/BSM Primaries

There are others deformations away from the SM that are harmless in the vacuum and need a Higgs field to be probed

e.g. $$\frac{1}{g_s^2} G_{\mu\nu}^2 + \frac{|H|^2}{\Lambda^2} G_{\mu\nu}^2 \to \left(\frac{1}{g_s^2} + \frac{v^2}{\Lambda^2} \right) G_{\mu\nu}^2$$

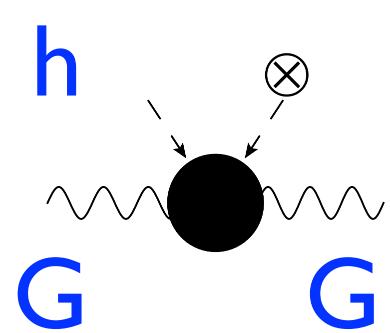
operator not visible in the vacuum
(redefinition of input parameter)





(courtesy of A. Pomarol@HiggsHunting2014)

But can affect h physics:



affects GG →h!

Higgs/BSM Primaries

How many of these effects can we have?

Pomarol, Riva '13
Elias-Miro et al '13
Gupta, Pomarol, Riva '14

As many as parameters in the SM: **8**

for one family

(assuming CP-conservation)

g_s — $|H|^2 G^A_{\mu\nu} G^{A\mu\nu}$ → **GGh coupling**

g — $|H|^2 B_{\mu\nu} B^{\mu\nu}$ → **hγγ coupling**

g' — $|H|^2 W^a_{\mu\nu} W^{\mu\nu\, a}$ → **hZγ coupling**

m_W — $|H|^2 |D_\mu H|^2$ → **hVV* (custodial invariant)**

m_h — $|H|^6$ → **h^3 coupling**

yet to be measured at the LHC

m_f $(f = t, b, \tau)$ — $|H|^2 \bar{f}_L H f_R + h.c.$ → **htt, hbb, $h\tau\tau$**

the 6 others have been measured (~15%)

(courtesy of A. Pomarol@HiggsHunting2014)

Higgs/BSM Primaries

How many of these effects can we have?

Pomarol, Riva '13

Elias-Miro et al '13

Gupta, Pomarol, Riva '14

Almost a 1-to-1 correspondence with the 8 κ's in the Higgs fit

Coupling	300 fb^{-1} Theory unc.: All	Half	None	3000 fb^{-1} Theory unc.: All	Half	None
κ_Z	8.1%	7.9%	7.9%	4.4%	4.0%	3.8%
κ_W	9.0%	8.7%	8.6%	5.1%	4.5%	4.2%
κ_t	22%	21%	20%	11%	8.5%	7.6%
κ_b	23%	22%	22%	12%	11%	10%
κ_τ	14%	14%	13%	9.7%	9.0%	8.8%
κ_μ	21%	21%	21%	7.5%	7.2%	7.1%
κ_g	14%	12%	11%	9.1%	6.5%	5.3%
κ_γ	9.3%	9.0%	8.9%	4.9%	4.3%	4.1%
$\kappa_{Z\gamma}$	24%	24%	24%	14%	14%	14%

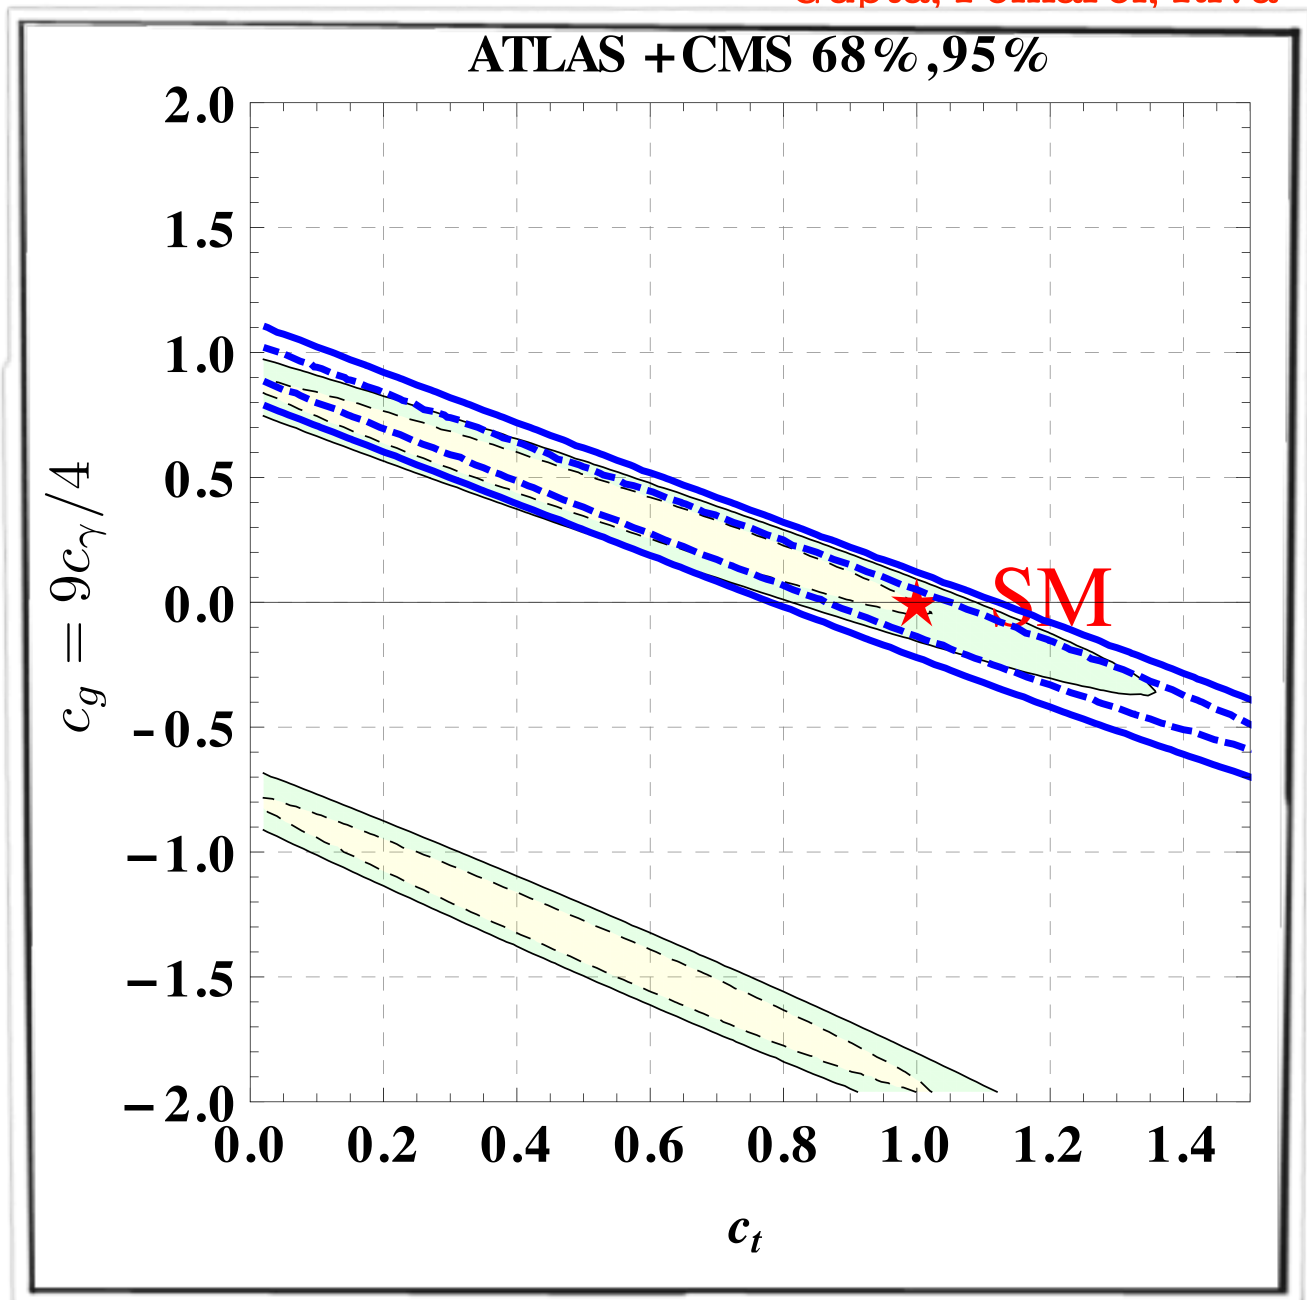
Atlas projection

With some important differences:

1) width hypothesis built-in

2) κ_W/κ_Z is not a primary (constrained by $\Delta\rho$ and TGC)

3) κ_g, κ_γ, $\kappa_{Z\gamma}$ do not separate UV and IR contributions

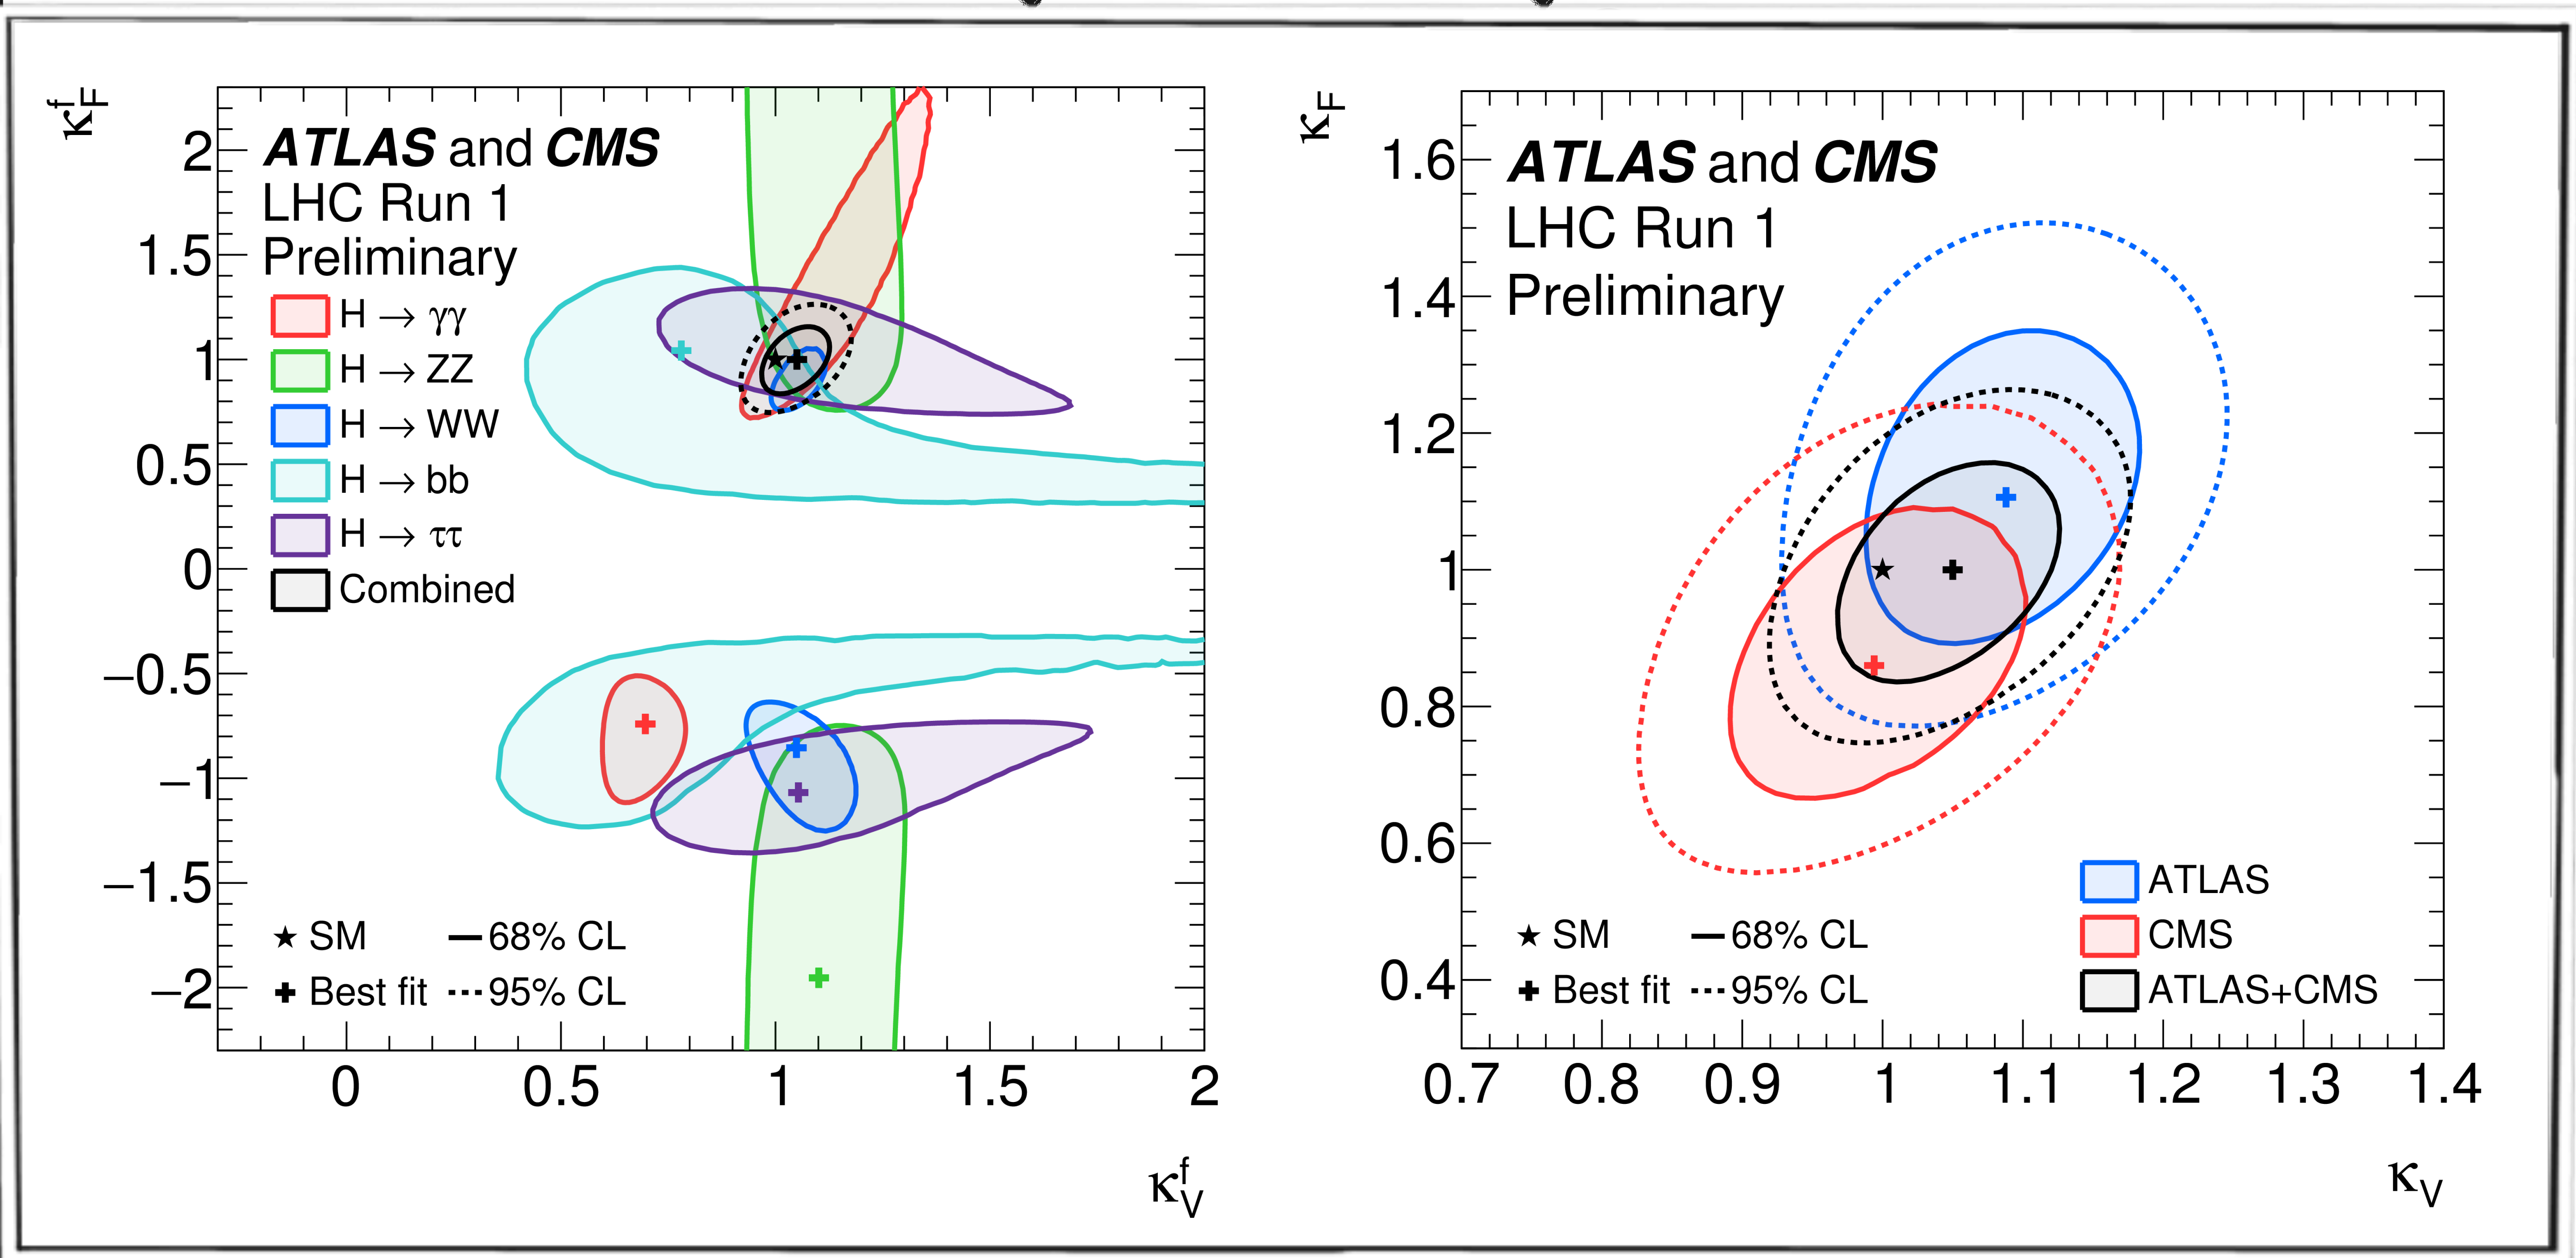


Azatov '15

the 6 others have been measured (~15%) up to a flat direction between between the top/gluon/photon couplings

Why going beyond inclusive Higgs processes?

So far the LHC has mostly produced Higgses on-shell
in processes with a characteristic scale $\mu \approx m_H$



Why going beyond inclusive Higgs processes?

So far the LHC has mostly produced Higgses on-shell
in processes with a characteristic scale $\mu \approx m_H$

⇩ ⇩

access to Higgs couplings @ m_H

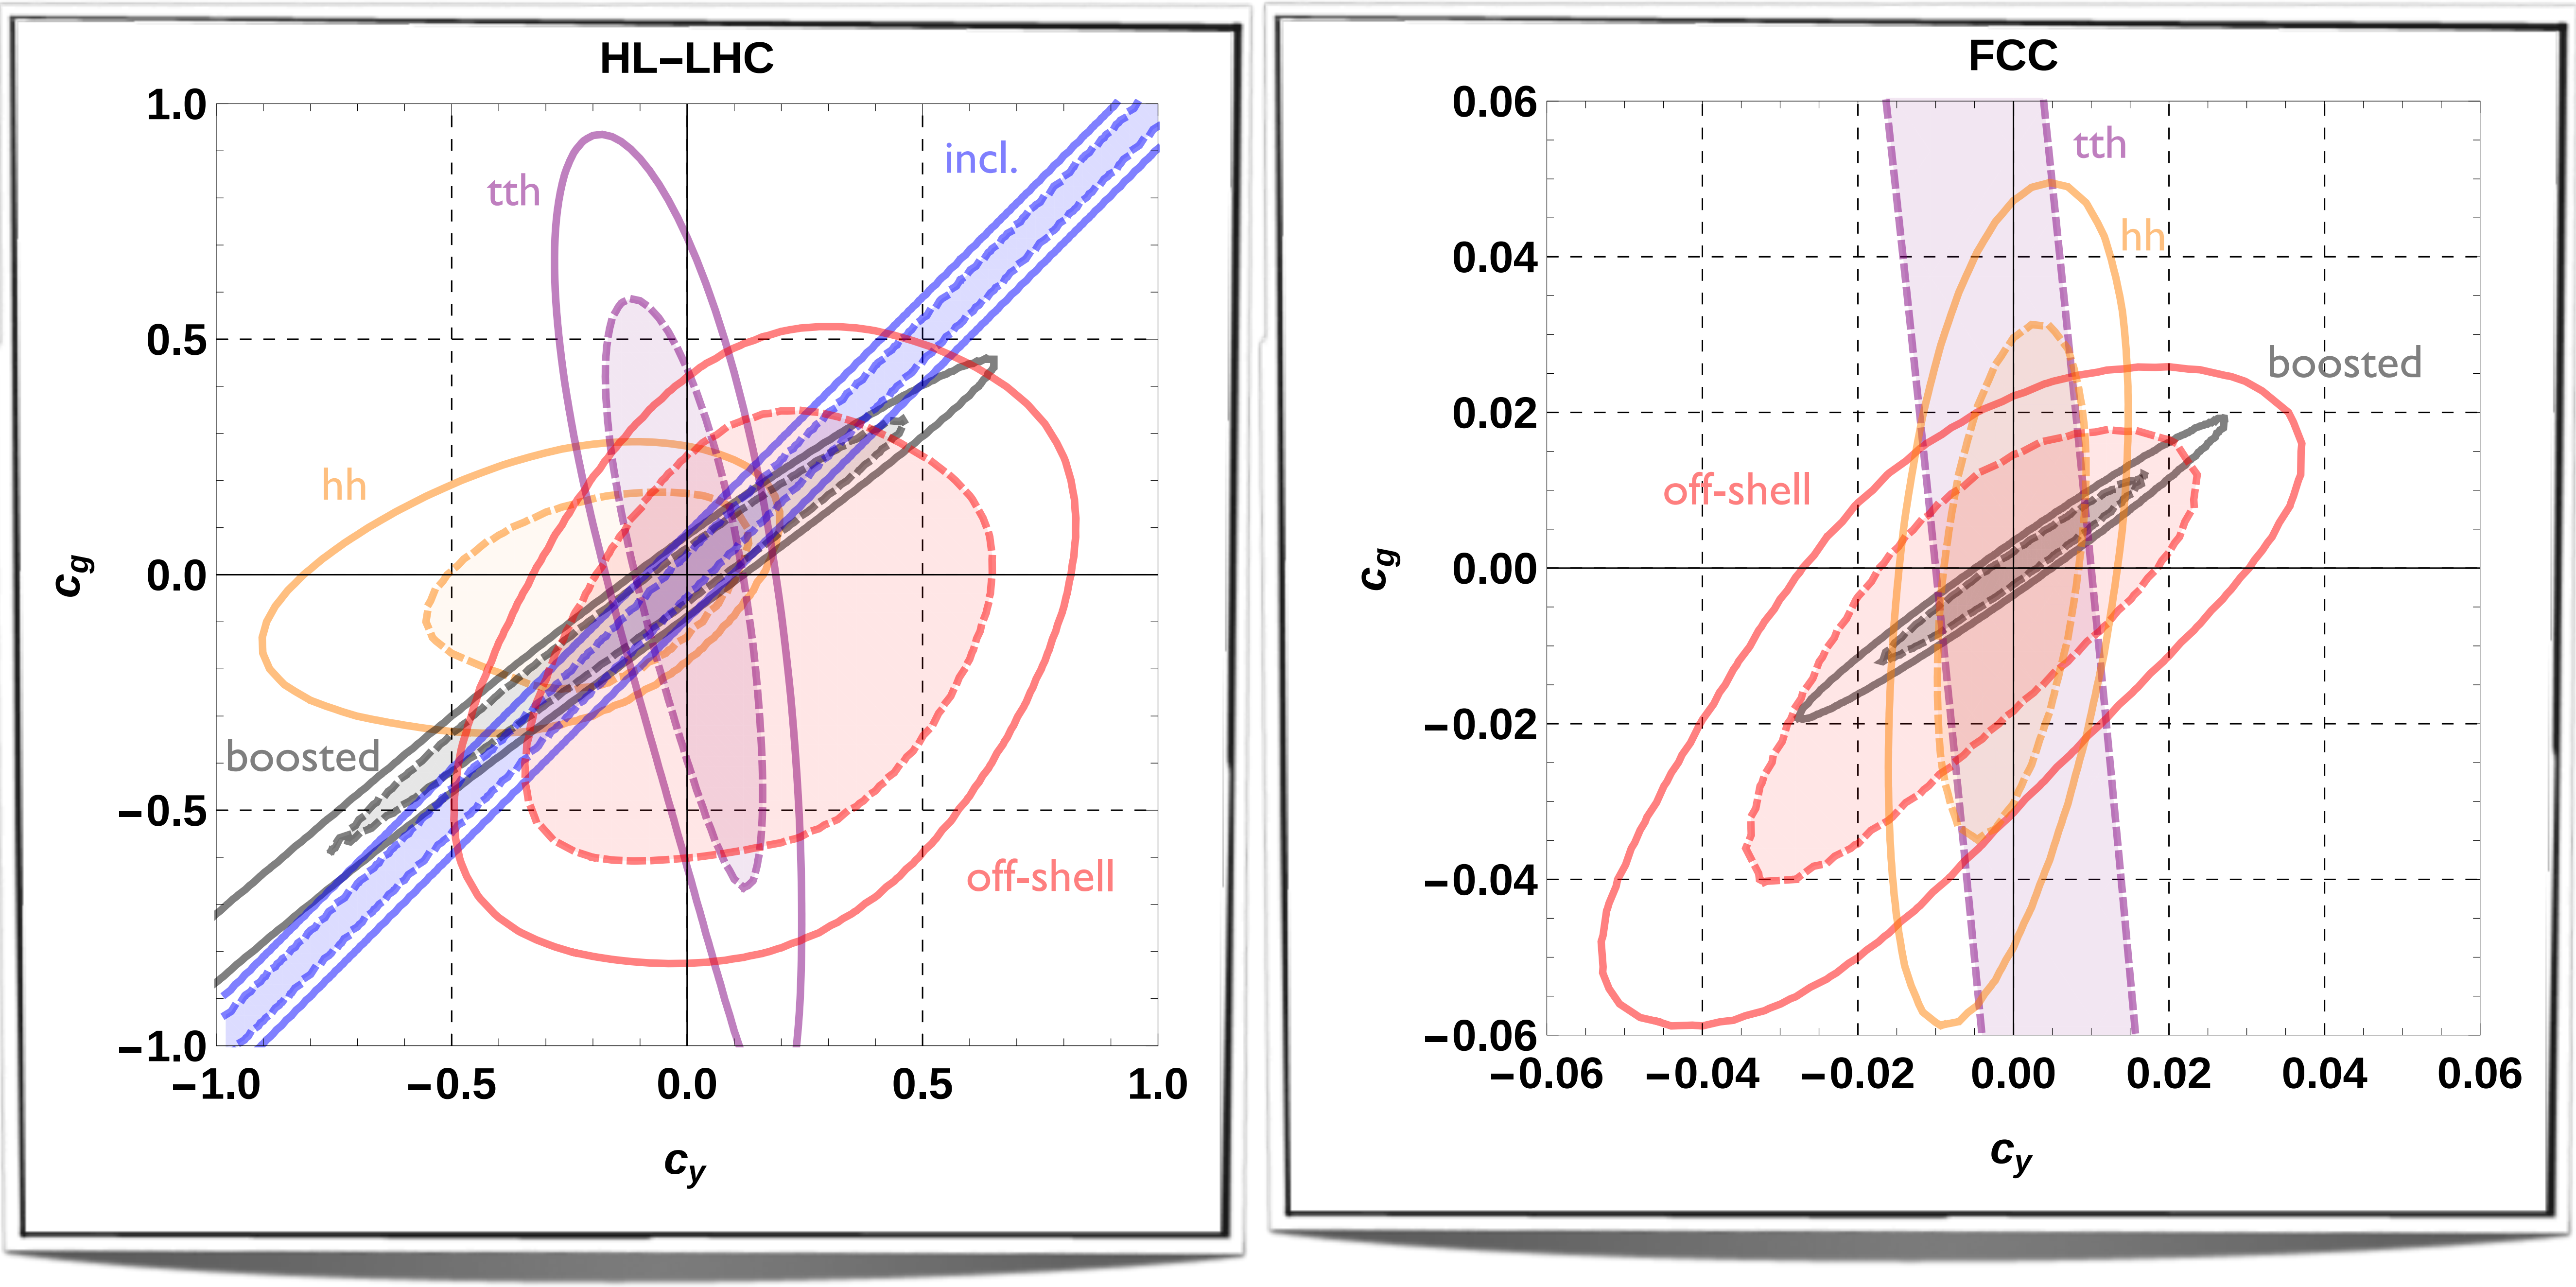
Producing a Higgs with boosted additional particle(s)
probe the Higgs couplings @ large energy
(important to check that the Higgs boson ensures perturbative unitarity)

Examples of interesting channels to explore further:

1. off-shell $gg \to h^* \to ZZ \to 4l$
2. boosted Higgs: Higgs+ high-p_T jet
3. double Higgs production

Why going beyond inclusive Higgs processes?

So far the LHC has mostly produced Higgses on-shell
in processes with a characteristic scale $\mu \approx m_H$



Azatov, Grojean, Paul, Salvioni '16

Usefulness of non-inclusive measurements

In Higgs inclusive measurements, top partners easily hide themselves
lightness of the Higgs makes it impossible to resolve the top-loop
top partners run in the loop and modify top Yukawa couplings ⇒ net effect=0

⇛ cannot disentangle
- long distance physics (modified top coupling)
- short distance physics (new particles running in the loop) ⇚

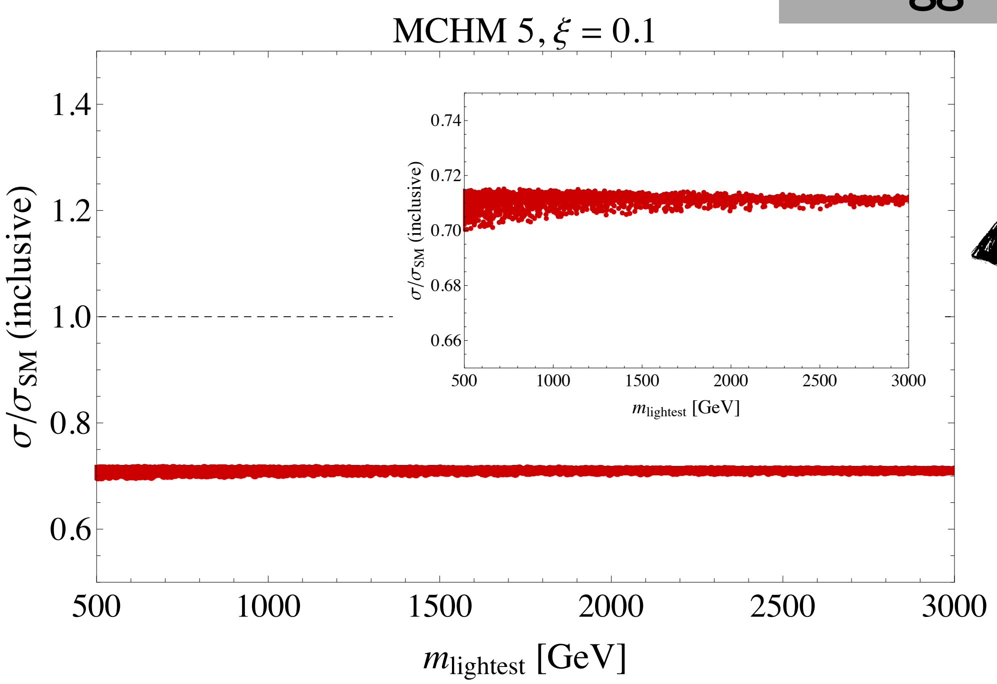
$$\mathcal{L} = \frac{\alpha_s c_g}{12\pi}|H|^2 G_{\mu\nu}^{a\,2} + \frac{\alpha c_\gamma}{2\pi}|H|^2 F_{\mu\nu} + y_t c_t \bar{q}_L \tilde{H} t_R |H|^2$$

$$\frac{\sigma(gg\to h)}{\text{SM}} = (1+(c_g - c_t)v^2)^2 \qquad \frac{\Gamma(h\to\gamma\gamma)}{\text{SM}} = (1+(c_\gamma - 4c_t/9)v^2)^2$$

fermionic top-partners in composite Higgs models exactly lead to $\Delta c_t = \Delta c_g = \frac{9}{4}\Delta c_\gamma.$

Need to look at differential distributions
Higgs+jet, off-shell Higgs production

Grojean et al '13



inclusive rate

Higgs w/ p_T>500 GeV

Higgs and BSM physics

Higgs & BSM: a love story

In the context of the SM, there is nothing more to learn from the Higgs

- **This is a blessing and a curse:**
  - **A curse, since we might spend the rest of our lives confirming what we already know**
  - **A blessing, since we now have all ingredients required to assess the (in)consistency of exptl data with the SM itself**

Two extreme BSM scenarios...

- EWSB is intrinsically BSM (e.g. composite Higgs)
  - Higgs properties are directly modified
- EWSB is basically SM, it is not affected by BSM
  - Higgs properties are not visibly modified, but BSM particles manifest themselves through the Higgs (e.g. $\chi_2 \to h\chi_1$)
- … plus every scenario in between

This makes Higgs physics immensely rich, diverse and challenging

(courtesy of M. Mangano@HiggsCouplings2016)

Higgs & BSM: a love story

There are many ways to look for BSM physics in the Higgs sector...

BSM Higgs searches

- Neutral heavy Higgs
- Charged Higgs
- Di-Higgs production
- Higgs as a portal to hidden sectors
- BSM constraints from coupling measurements
- Higgs in decay chains
- Higgs exotic decays
- Higgs lepton flavor violating decays

T. Guilemin@Search'16

Plenty of opportunities to discover new particles...
but we also want to learn about new structures and new principles

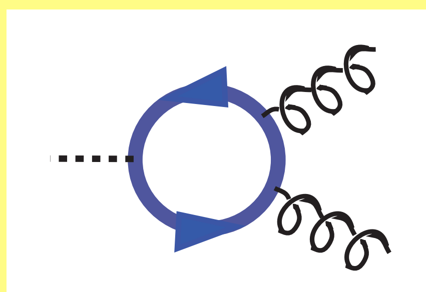
Higgs couplings as a test of naturalness

$$-(125\ \text{GeV})^2\left(\frac{\Lambda}{600\ \text{GeV}}\right)^2 \qquad\qquad \frac{g_*^2}{16\pi^2}\Lambda^2$$

$\delta m_H^2 =$ 
$+$ 

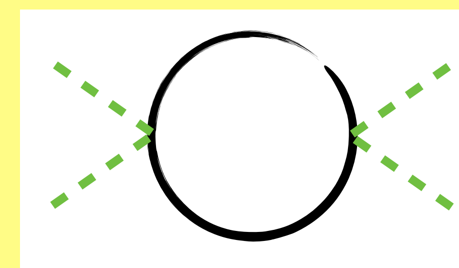
$\sim m_H^2$

charged particles — generically — neutral particles



$$\frac{g_s^2 g_*^2}{16\pi^2}\frac{1}{m_*^2}|H|^2 G_{\mu\nu}^2 \qquad \frac{e^2 g_*^2}{16\pi^2}\frac{1}{m_*^2}|H|^2 F_{\mu\nu}^2$$

$$\frac{\Delta BR(h\to\gamma\gamma, Z\gamma, gg)}{\text{SM}} \sim \frac{g_*^2 v^2}{m_*^2}$$



$$\frac{g_*^2}{16\pi^2}\frac{1}{m_*^2}\left(\partial_\mu |H|^2\right)^2$$

$$BR(h\to ii) = BR_{\text{SM}} \qquad \Gamma = \left(1 - \frac{g_*^2 v^2}{16\pi^2 m_*^2}\right)\Gamma_{\text{SM}}$$

$$\delta\sigma_{Zh} = -\frac{g_\star^2}{8\pi^2}\frac{v^2}{m_\star^2}$$

nice to be able to measure Zh & Γ

Colorful naturalness probed @ LHC

Neutral naturalness (invisible?) @ LHC
aka twin Higgs

Top partners in Composite Higgs models

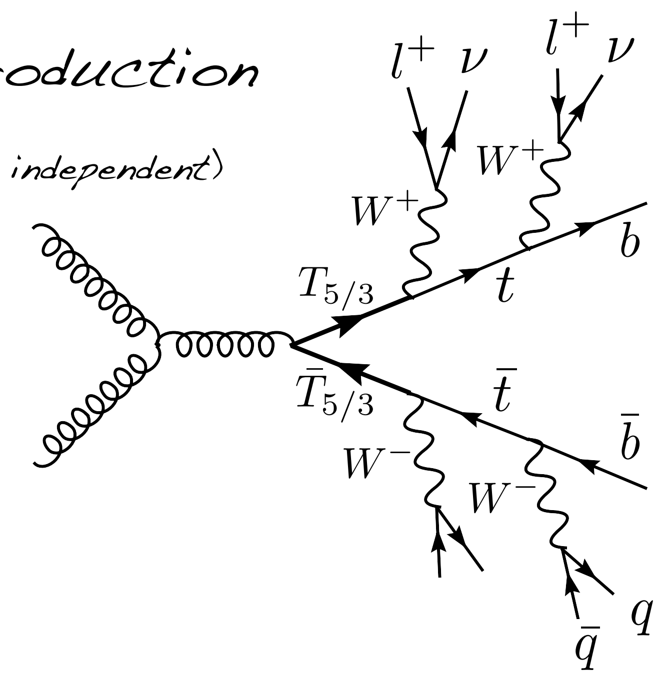
top partners searches in composite models:

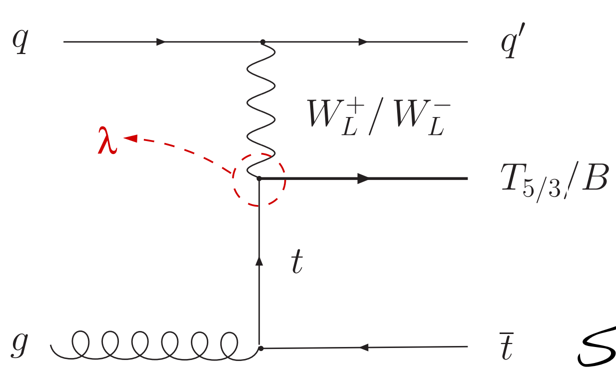
Search in same-sign dilepton events

- *tt+jets* is not a background [except for charge mis-ID and fake e⁻]
- the resonant (*tW*) invariant mass can be reconstructed

Pair production

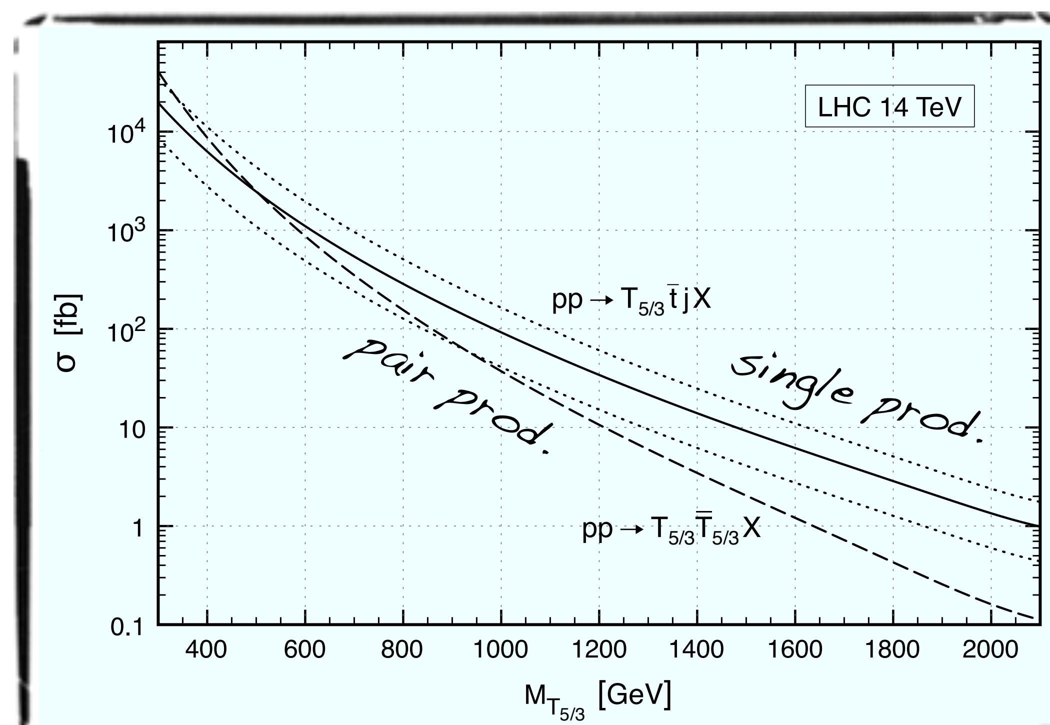
(model independent)





Single production

(model dependent)



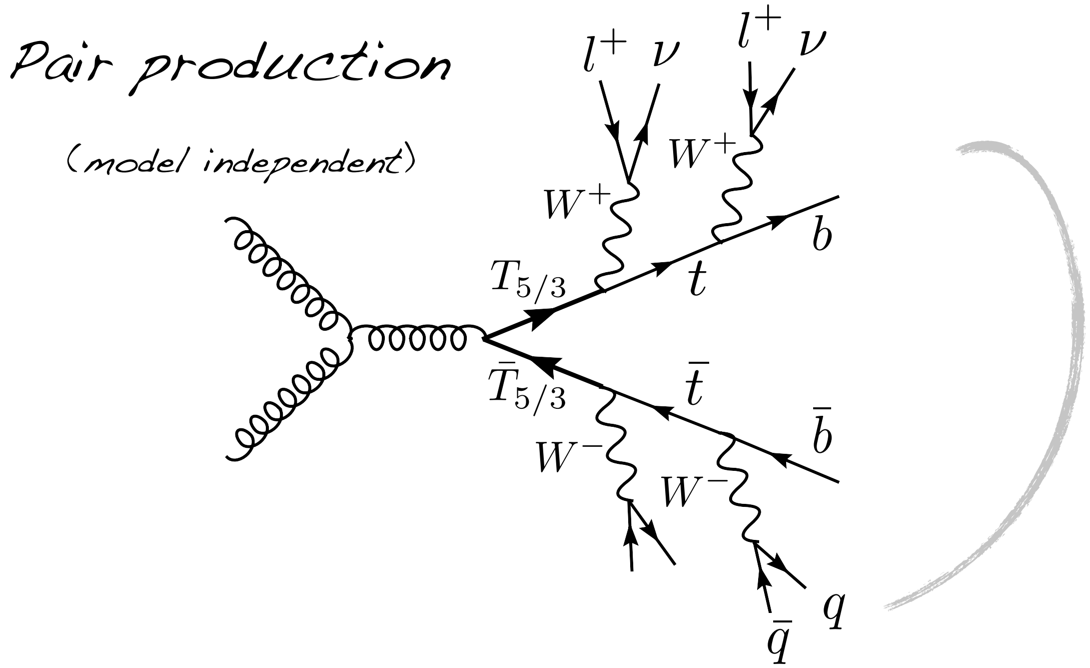
[Contino, Servant '08]

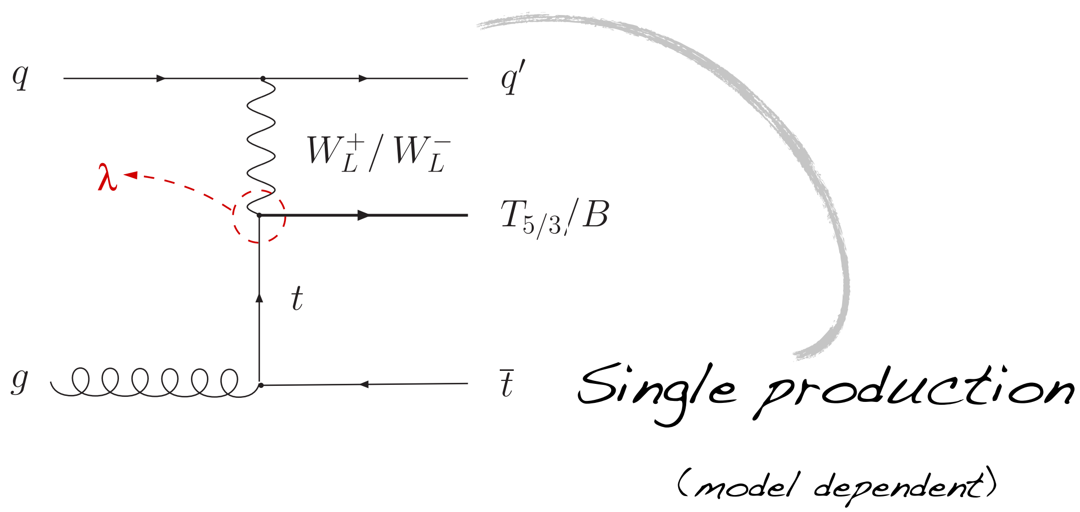
Top partners in Composite Higgs models

top partners searches in composite models:

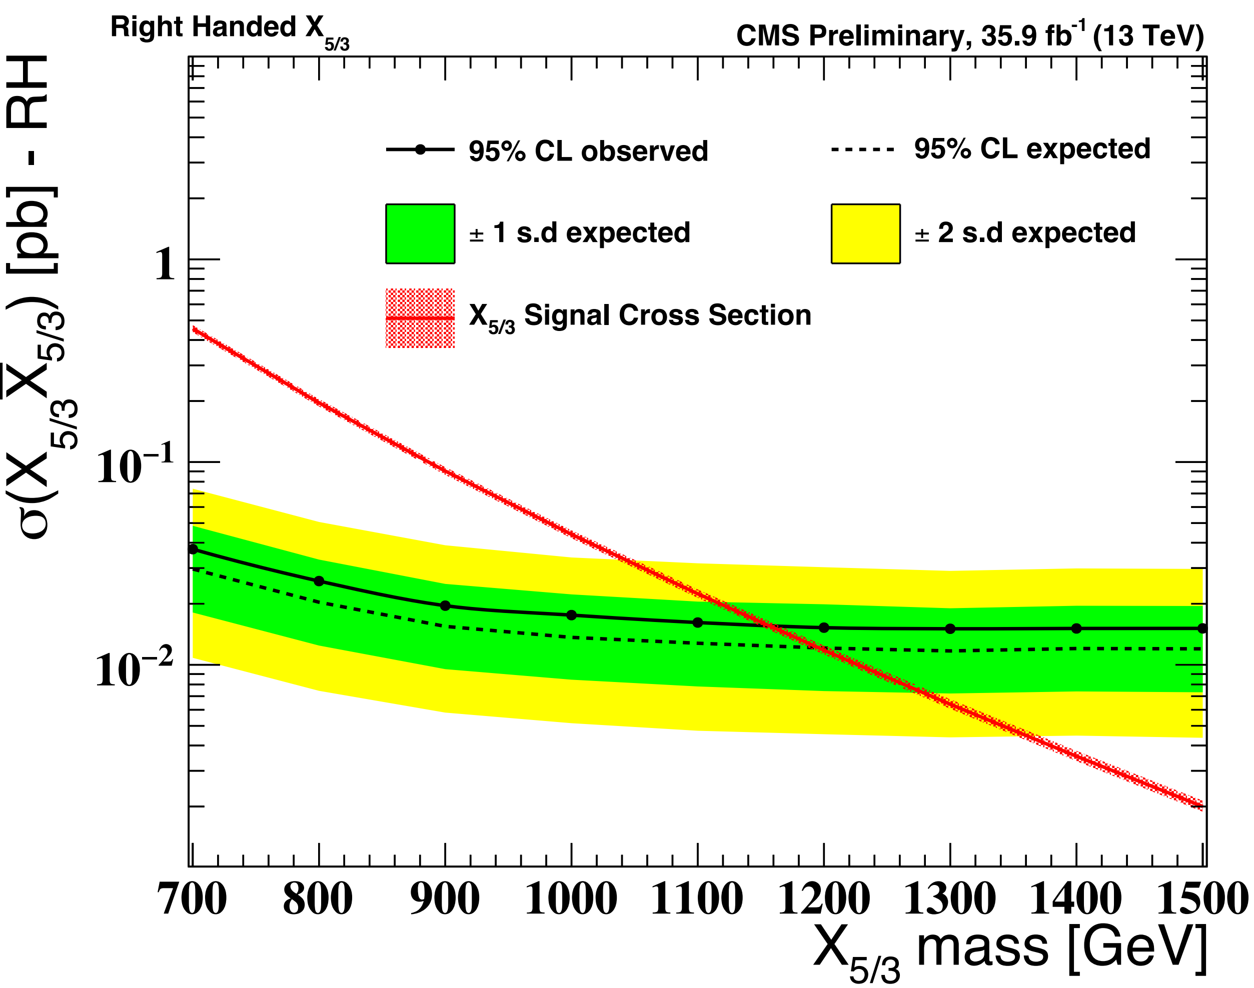
Search in same-sign dilepton events

- $t\bar{t}$+jets is not a background [except for charge mis-ID and fake e⁻]
- the resonant (tW) invariant mass can be reconstructed

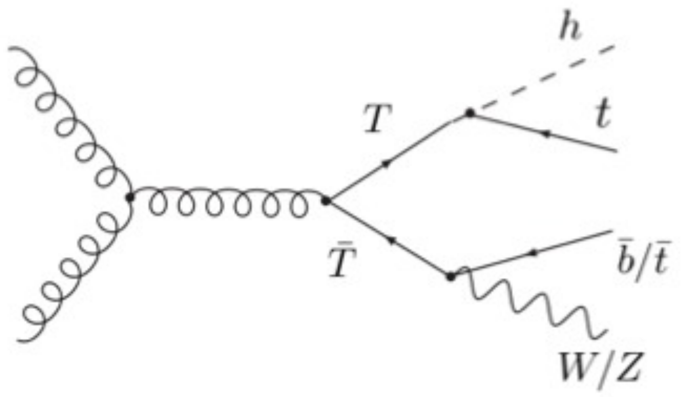




Moriond'17 bound: 1160 GeV



Top partners in Composite Higgs models



◉ $\ell^{\pm}$ + 4b final state Aguilar-Saavedra '09

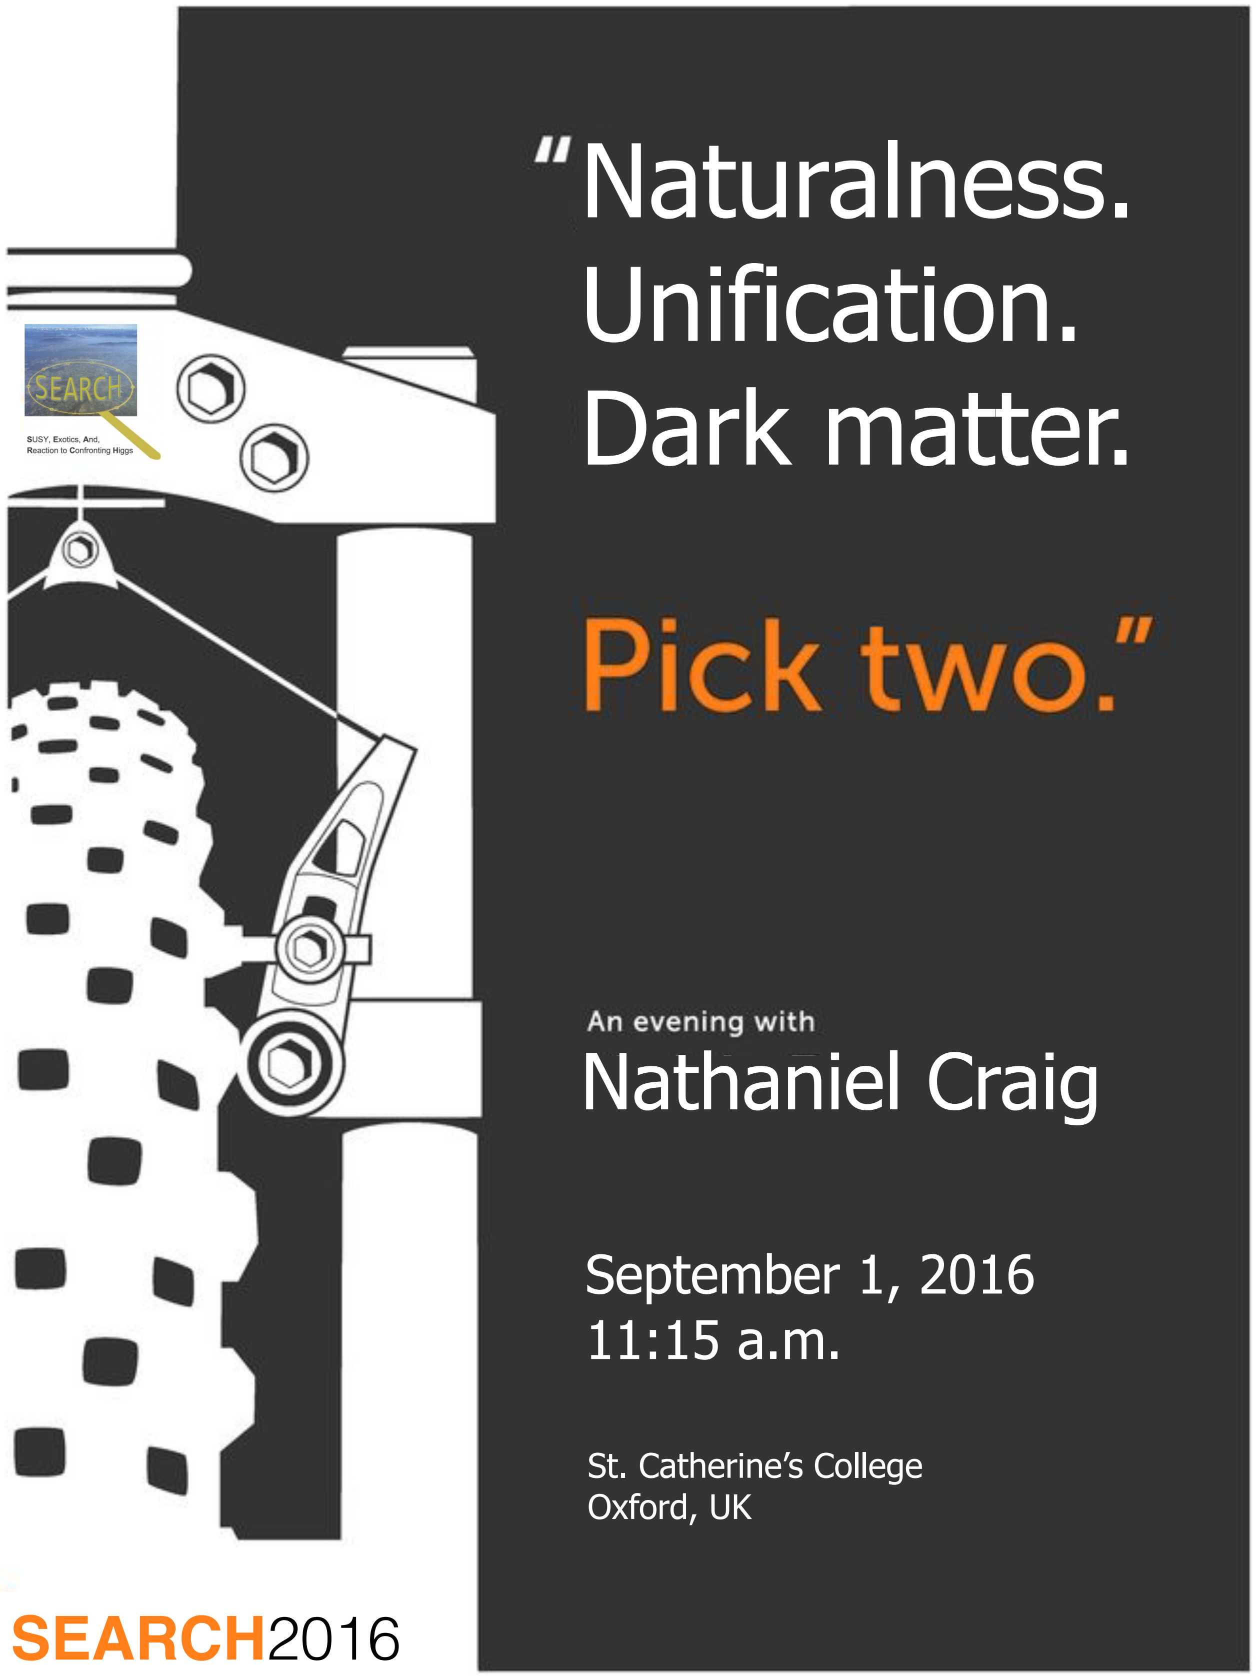
Status of SUSY model building

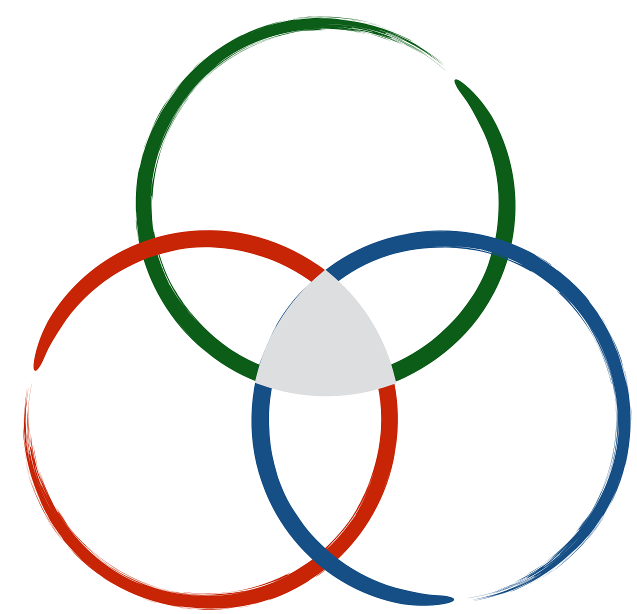
N. Craig@Search'16



Supersymmetry in light of data:

Impossible to have a simple theory that is natural, unifies, and gives WIMP DM.

Picking two is a useful guide.

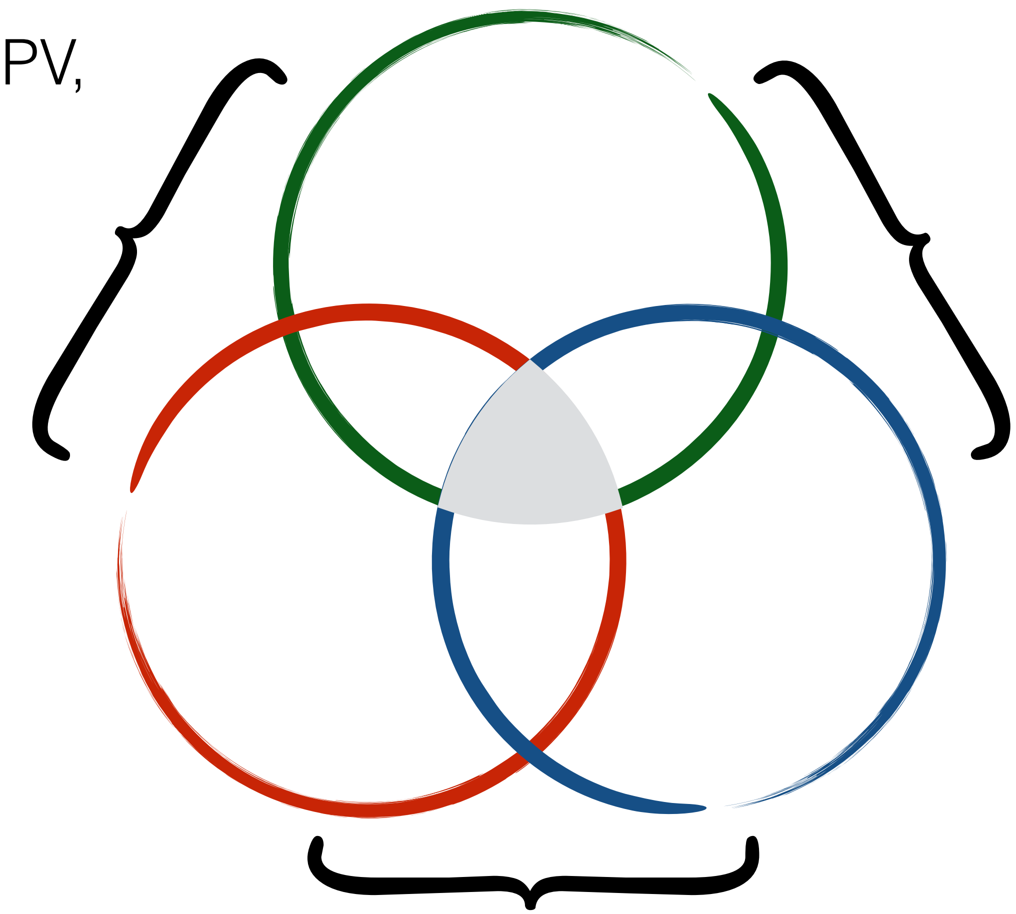


Status of SUSY model building

N. Craig@Search'16

Naturalness & Unification

- Light-flavor UDD RPV, LQD w/ taus
- RPV Higgsino
- Higgs properties
- <Your idea here>



Naturalness & Dark Matter

- Additional states near weak scale (sgluon, KK resonances, …)
- Higgs properties
- <Your idea here>

Unification & Dark Matter

- Conventional split SUSY searches
- Pure wino, higgsino LSP
- Extended Higgs sector?
- <Your idea here>

Rich wealth of opportunities with "unconventional" signatures
The search must go on!

SUSY Facts from LHC

m_{h}=125 GeV is independently pushing up the SUSY-scale in the MSSM.

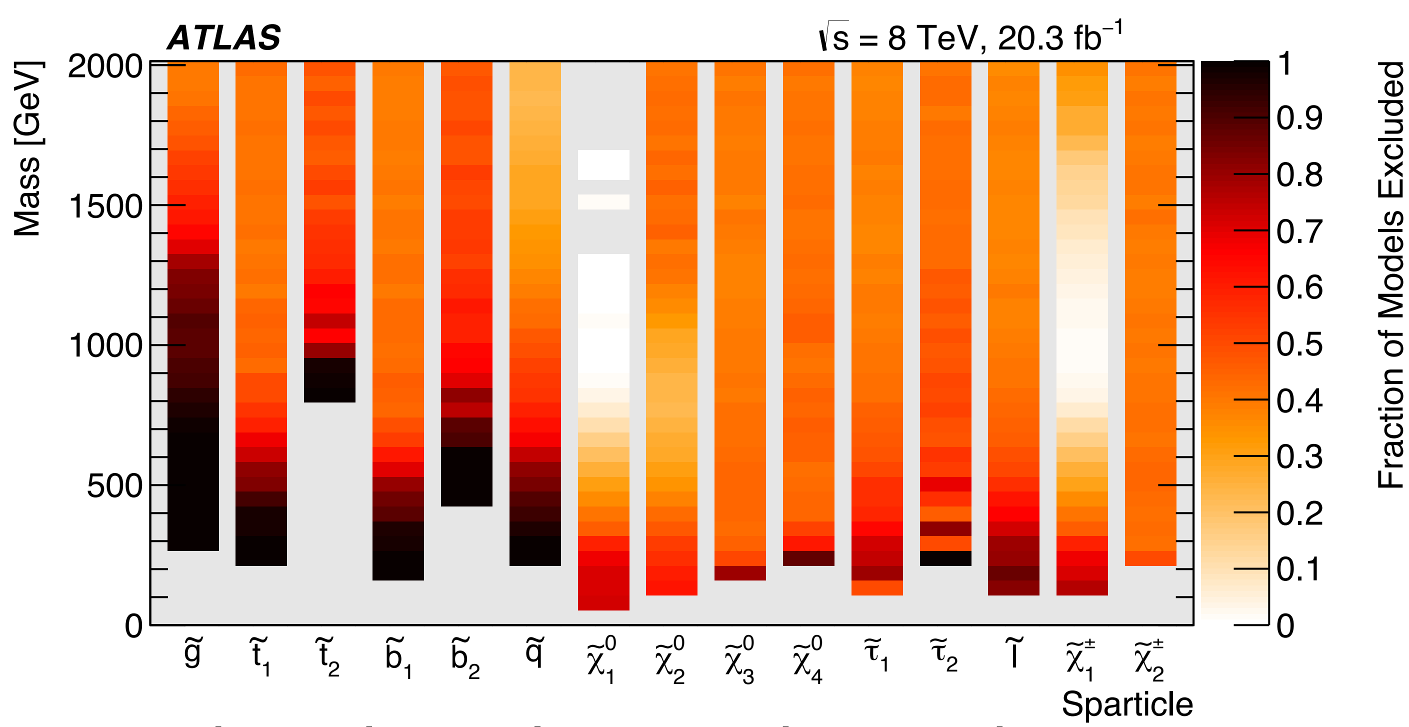
1)

$$m_h^2 = m_Z^2 \cos^2(2\beta) + \frac{3v^2}{4\pi^2}\left(|y_t|^4 \log\left(\frac{M_S^2}{m_t^2}\right) + \frac{A_t^2}{M_S^2}\left(|y_t|^2 - \frac{A_t^2}{12 M_S^2}\right)\right) + \dots$$

Famous bound $(m_h)_{tree} < m_Z$.

Need loop corrections from heavy stops to raise it to 125 GeV.

2)



bounds on gluinos and stops above 1 TeV

Naturalness criterium is challenged

but no reason to give up!

plenty of ways around
but need beyond minimal models

Searching for the missing top partners

"Looking and not finding is different than not looking"

giving the null search results, the top partners should either be

- **heavy** (harder to produce because of phase space)
- **stealthy** (easy to produce but hard to distinguish from background, e.g. $m_{stop} \sim m_{top}$)
- **colorless** (hard to produce, unusual decay)

need to go beyond traditional searches

	Scalar Top Partner	Fermion Top Partner
All SM Charges	SUSY	pNGB/RS
EW Charges	Folded SUSY	Quirky Little Higgs
No SM Charges	???	Twin Higgs

(C. Verhaaren@NKPI'16)

only little corner of theory/model space has been explored so far

require **hidden QCD** with a higher confining scale:

⇒ 1) hidden glueball (0^{++}) that can mix with Higgs
$h \to G_0 G_0 \to 4l$ with displaced vertices

Curtin, Verhaaren '15

⇒ 2) emerging jets

Schwaller, Stolarski, Weiler '15

Evading EXP bounds

the stringent bounds from ATLAS/CMS on susy/composite models
force theorists to go beyond minimal/simple models

SUSY is Natural but not plain vanilla

- ~~CMSSM~~
- pMSSM
- NMSSM
- Hide SUSY, e.g. smaller phase space
  - reduce production (eg. split families) Mahbubani et al
  - reduce MET (e.g. ~~R-parity~~, compressed spectrum) Csaki et al
  - dilute MET (decay to invisible particles with more invisible particles)
  - soften MET (stealth susy, stop -top degeneracy) Fan et al

composite models involving top partners with really exotic charges

"Hyperfolded Composite Higgs"

or how to get spin-1/2 partners with unconventional charges **preliminary**

Symmetry breaking pattern:

$$\mathrm{SU}(3)_G \times \mathrm{SU}(2)_X \times \mathrm{U}(1)_Z \to \mathrm{SU}(2)_L \times \mathrm{SU}(2)_X \times \mathrm{U}(1)_Y$$

$$\Phi \sim (\bar{3},1)_{\frac{1}{3}} = \exp\left(-i\frac{\pi^a T_G^a}{f}\right)\begin{pmatrix}0\\0\\f\end{pmatrix} \approx \begin{pmatrix}H\\ f - \frac{H^\dagger H}{2f}\end{pmatrix}$$

exotic decays of top partners

SM electroweak group generators:

$$T_L^{1,2,3} = T_G^{1,2,3} \qquad Y = Z - \frac{T_G^8}{\sqrt{3}} + \left(\frac{2}{3} - Y_T\right) T_X^3$$

free parameter, to become the top-partner hypercharge

Since the charge-Y_T partner does not mix with the SM quarks, the usual decays to W/Z/h + quark are absent.

Instead, the decay may proceed via a higher-dimensional operator. For example, the operator

$$\mathcal{L} \propto \bar{X}_\alpha^\dagger \bar{u}_{i\beta}^\dagger \bar{d}_j^\alpha \bar{d}_k^\beta + \text{h.c.}$$

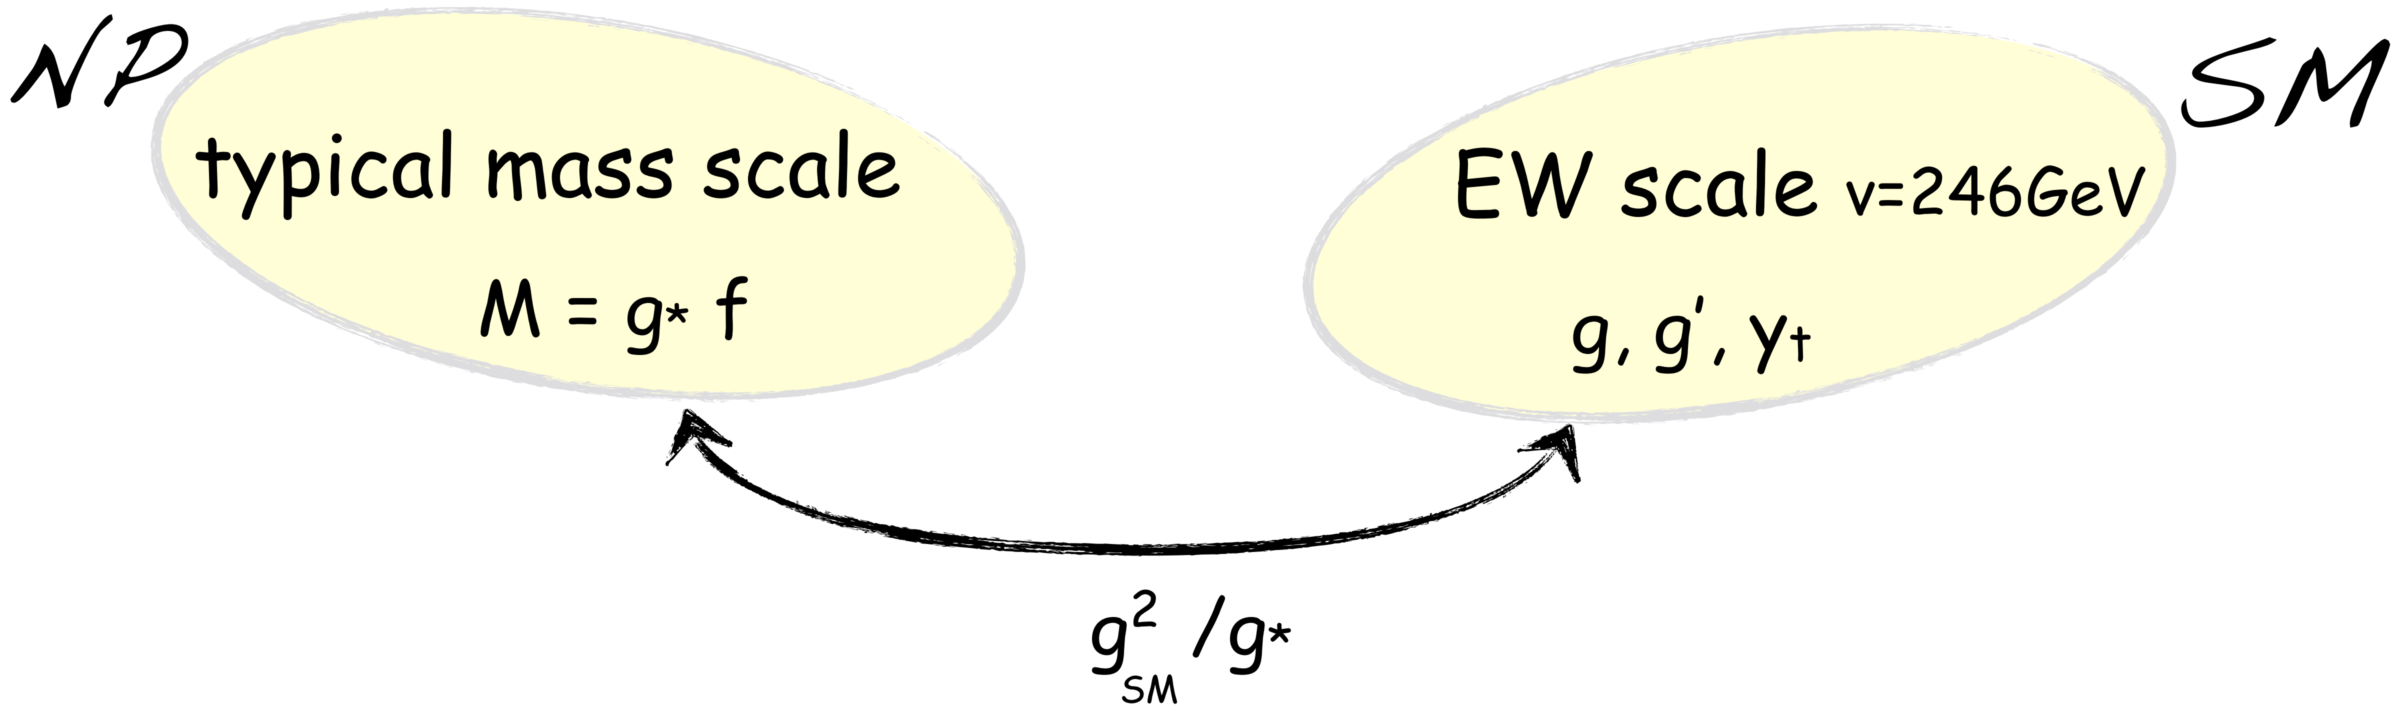
may give the potentially elusive decays

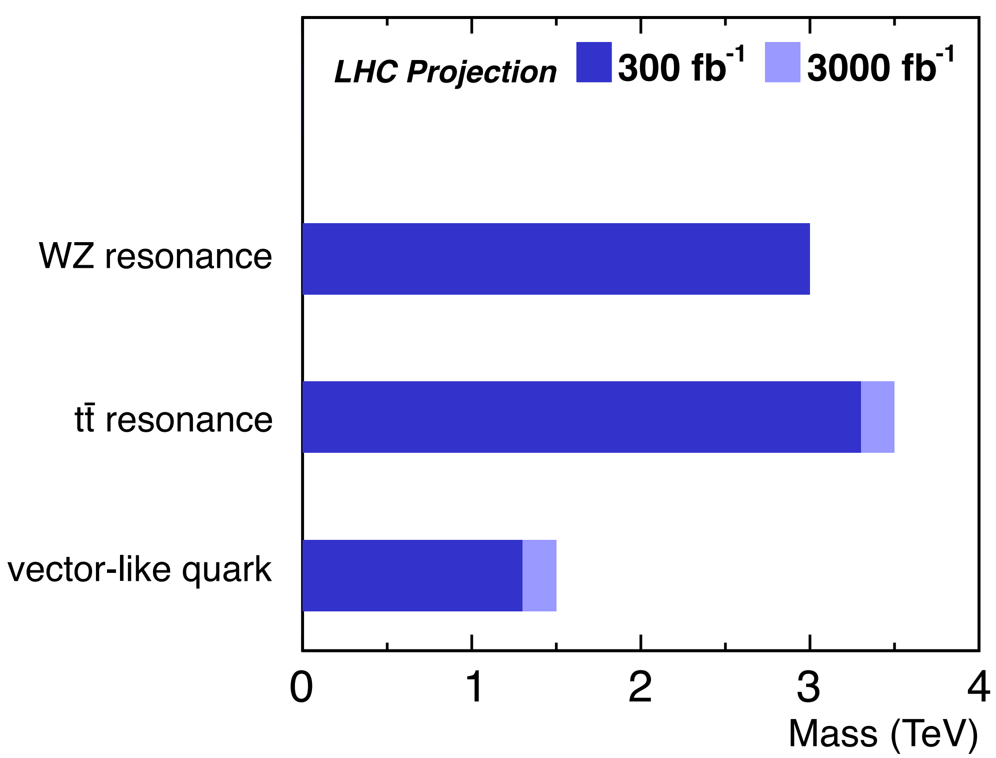
$$X \to jjj,\ tjj$$

Y. Kats @ DESY '16

Higgs & New Physics (Vectors)

Precision /indirect searches (high lumi.) vs. direct searches (high energy)





LHC direct search

- Precision Higgs study: $\xi \equiv \frac{\delta g}{g} = \frac{v^2}{f^2}$
- Direct searches for resonances: $m_\rho \approx g_* f$

Which one is doing best?
it depends on value of g_*

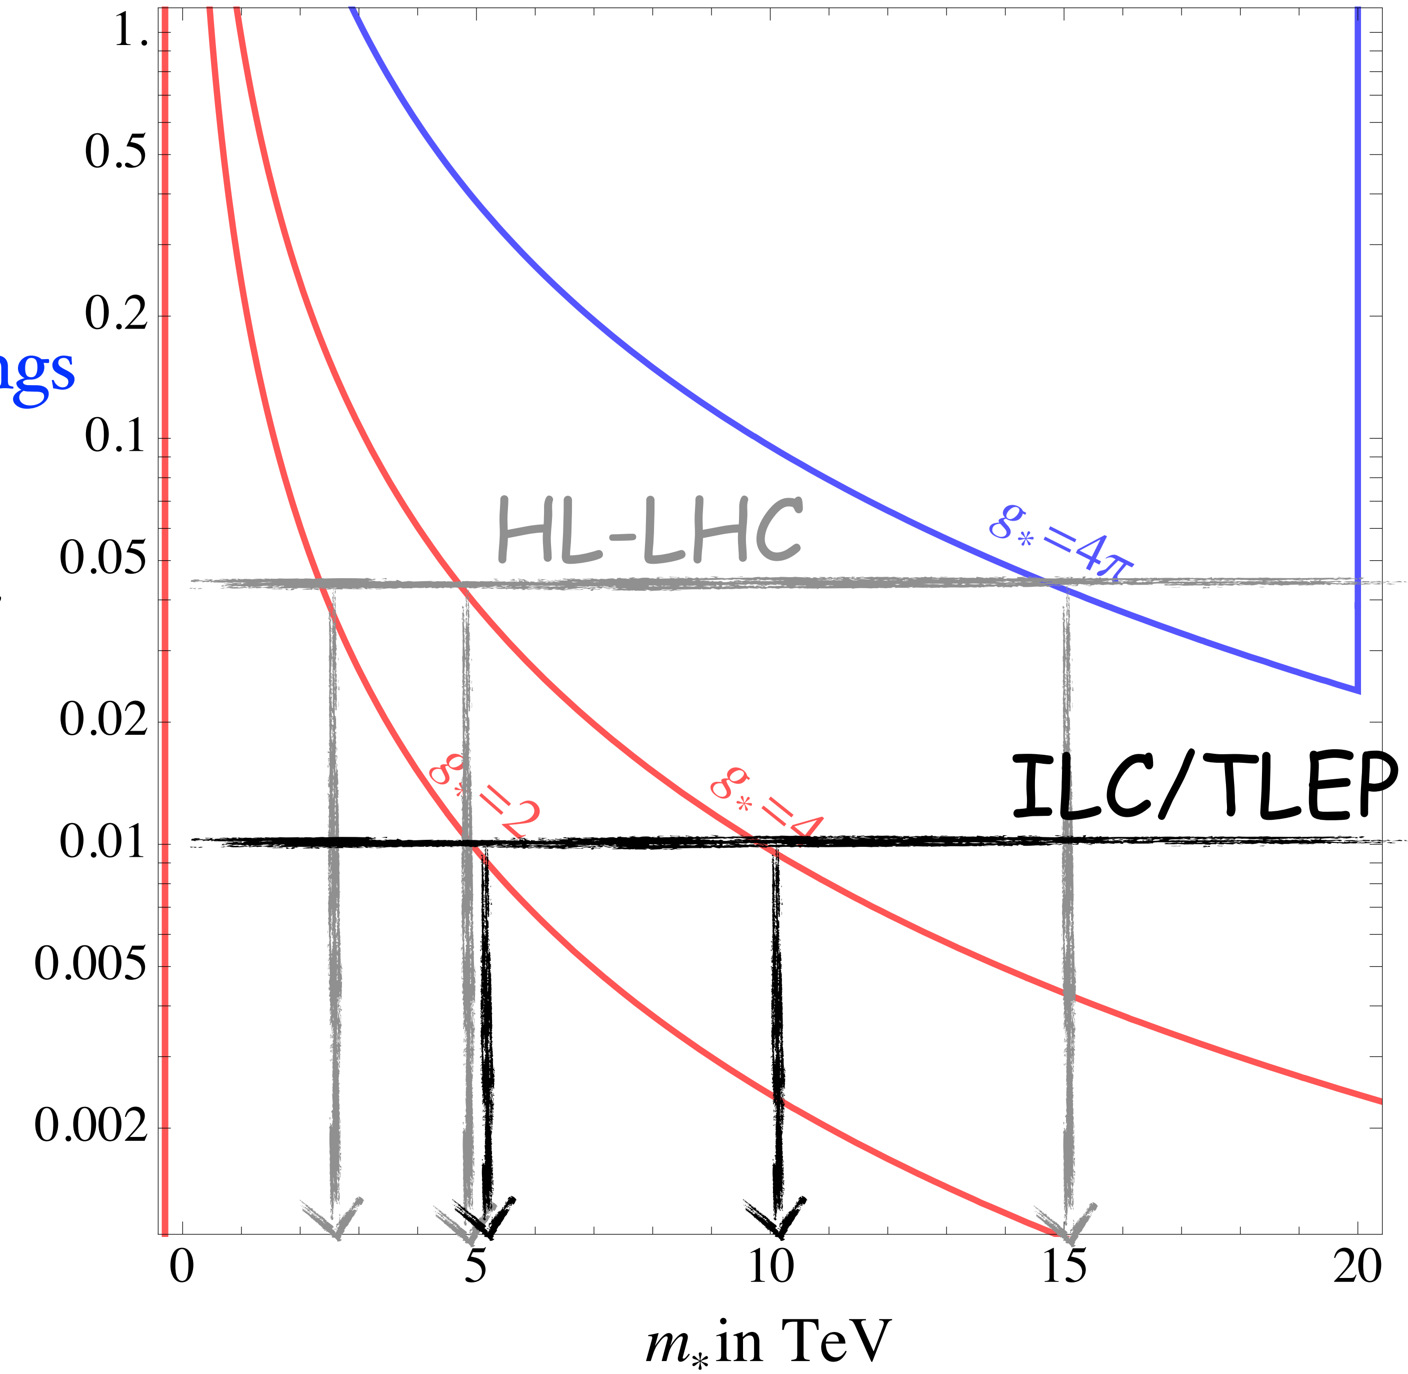
Higgs & New Physics (Vectors)

Precision /indirect searches (high lumi.) vs. direct searches (high energy)

Mass reach:

a deviation in Higgs couplings also teaches us on the maximum mass scale to search for!
e.g. 10% deviation ⇛ m_V < 10TeV i.e. resonance within the reach of FCC-hh

Higgs couplings



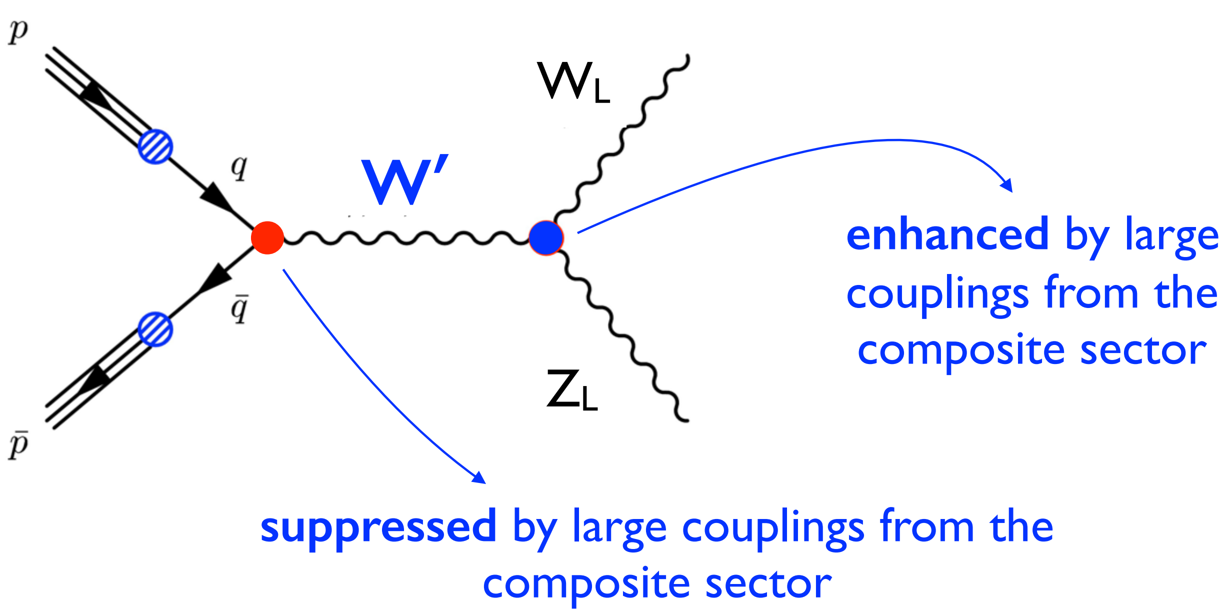
direct searches

Rattazzi, BSM@100TeV, CERN '14

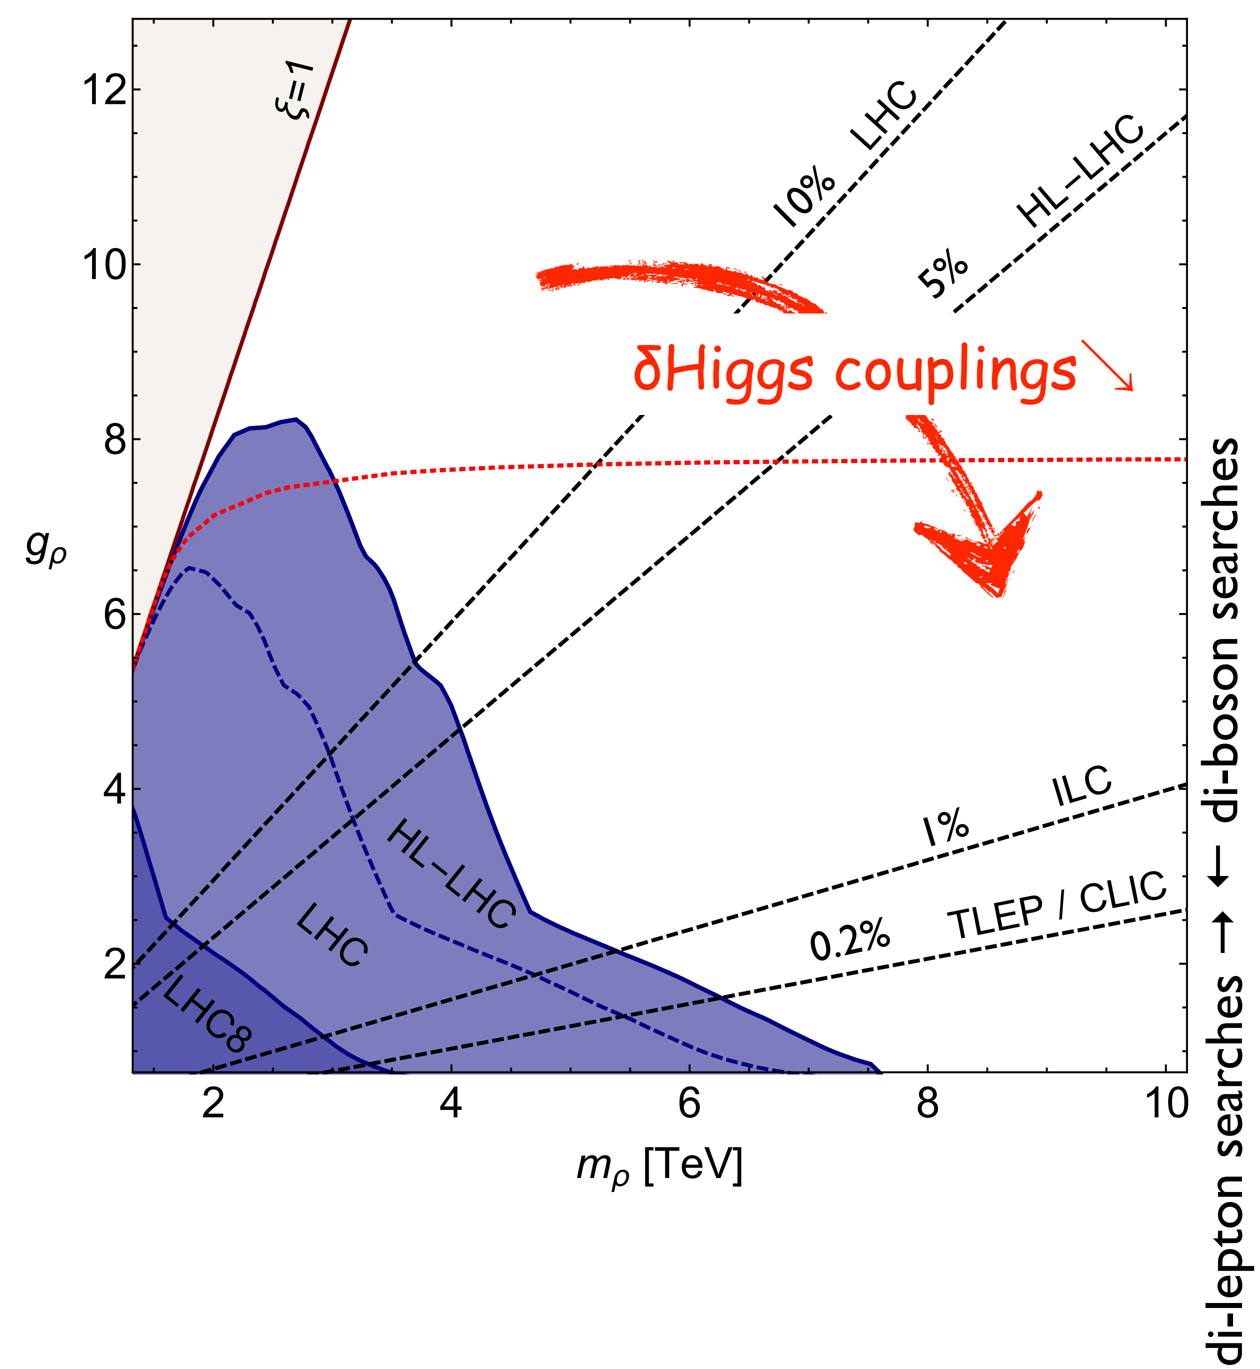
Higgs & New Physics (Vectors)

Precision /indirect searches (high lumi.) vs. direct searches (high energy)

Torre, Thamm, Wulzer '15



DY production xs of resonances decreases as $1/g_\rho^2$



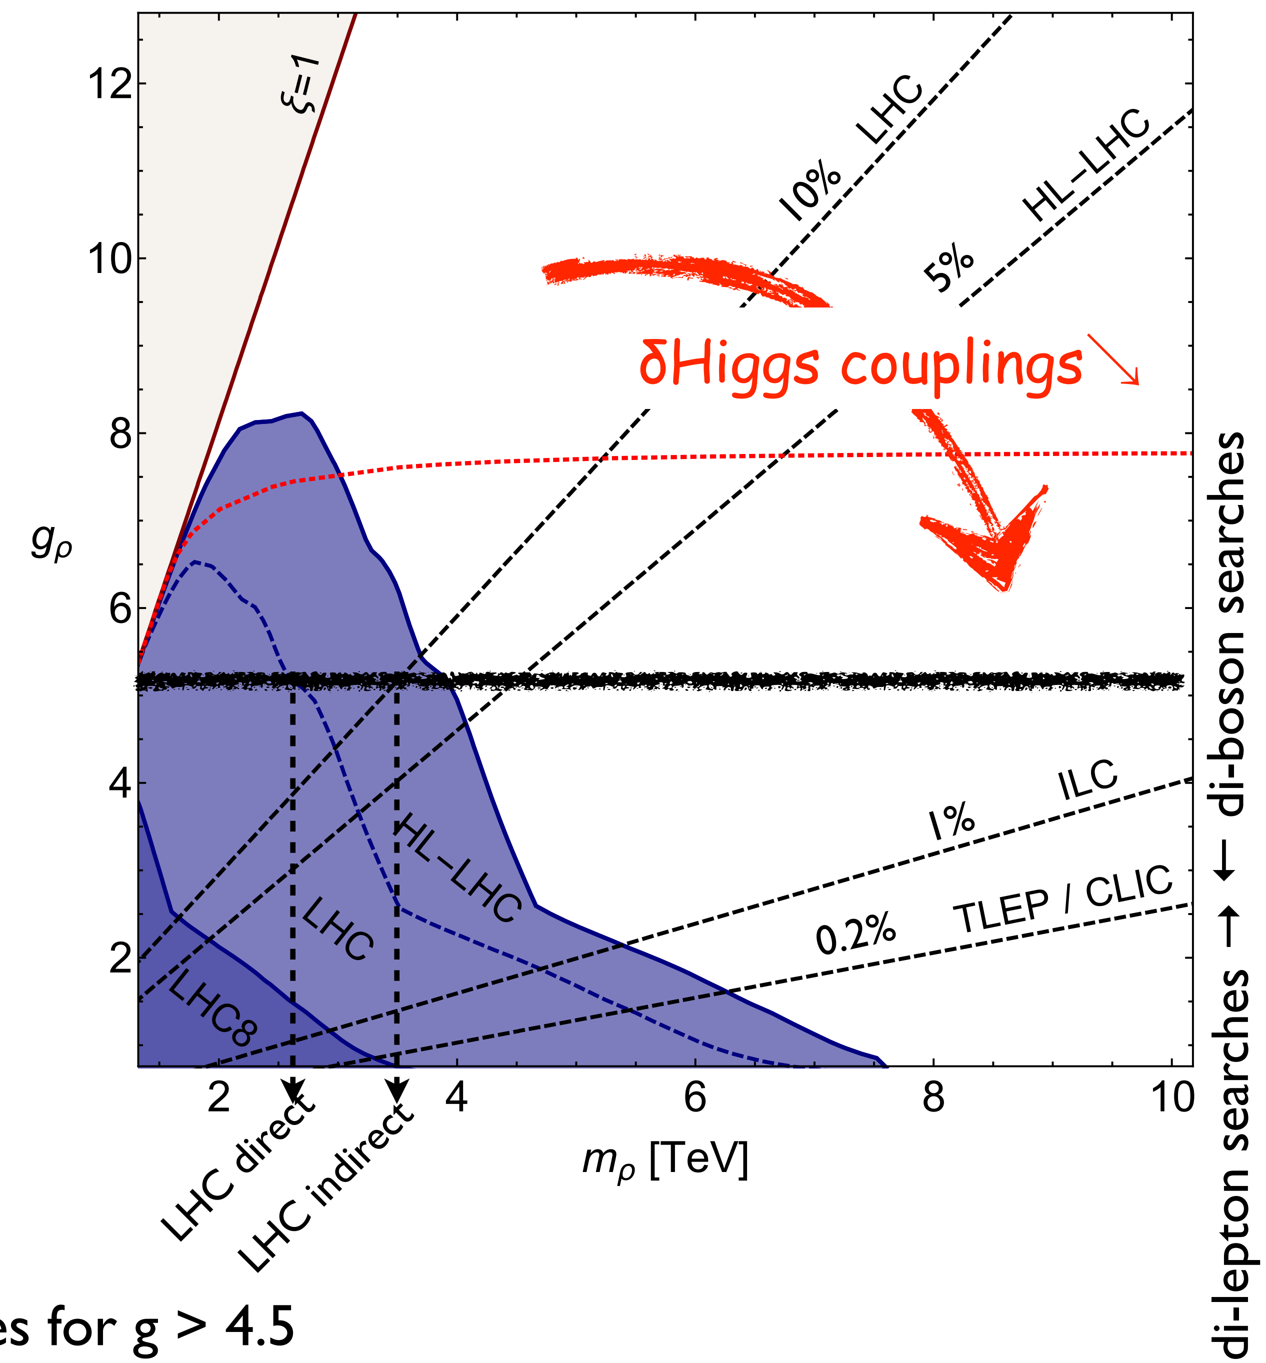
Higgs & New Physics (Vectors)

Precision /indirect searches (high lumi.) vs. direct searches (high energy)

Torre, Thamm, Wulzer '15

Collider	Energy	Luminosity	ξ [1σ]
LHC	14 TeV	300 fb^{-1}	$6.6 - 11.4 \times 10^{-2}$
LHC	14 TeV	3 ab^{-1}	$4 - 10 \times 10^{-2}$
ILC	250 GeV + 500 GeV	250 fb^{-1} 500 fb^{-1}	4.8-7.8 $\times 10^{-3}$
CLIC	350 GeV + 1.4 TeV + 3.0 TeV	500 fb^{-1} 1.5 ab^{-1} 2 ab^{-1}	2.2 $\times 10^{-3}$
TLEP	240 GeV + 350 GeV	10 ab^{-1} 2.6 ab^{-1}	2×10^{-3}

DY production xs of resonances decreases as $1/g_\rho^2$



- **complementarity:**
  - direct searches win at small couplings
  - indirect searches probe new territory at large coupling

e.g.
indirect searches at LHC over-perform direct searches for g > 4.5
indirect searches at ILC over-perform direct searches at HL-LHC for g > 2

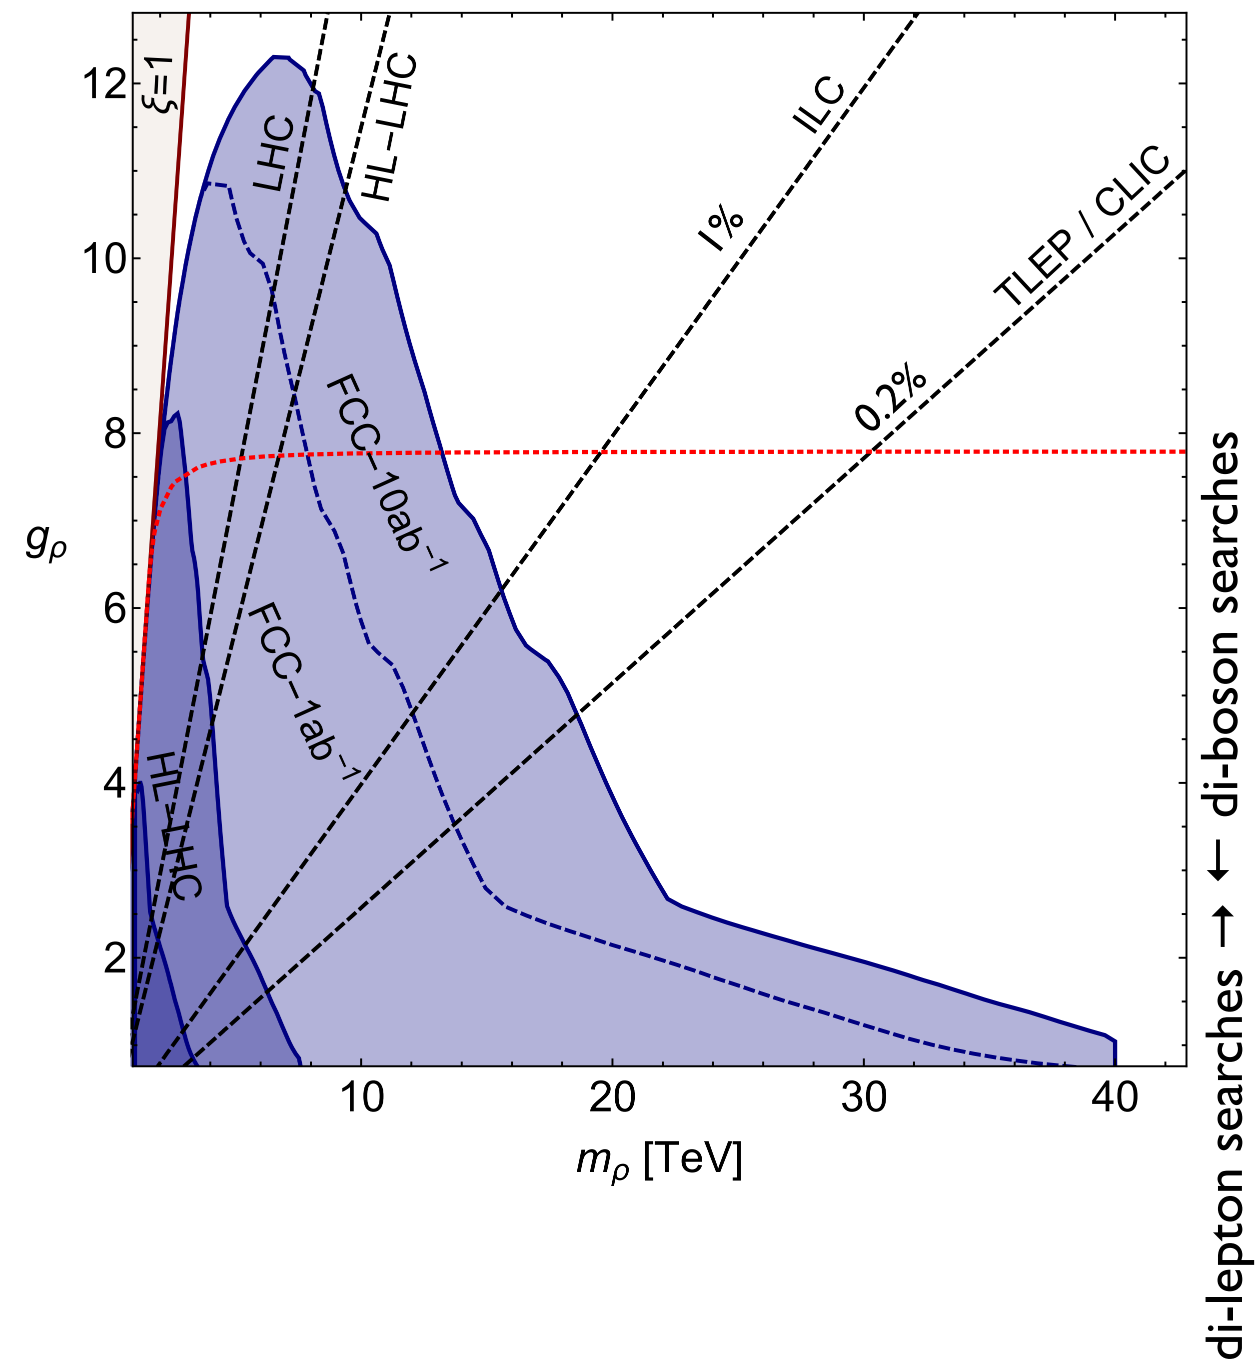
Higgs & New Physics (Vectors)

Precision /indirect searches (high lumi.) vs. direct searches (high energy)

DY production xs of resonances decreases as $1/g_\rho^2$

Torre, Thamm, Wulzer '15

Collider	Energy	Luminosity	ξ [1σ]
LHC	14 TeV	300 fb^{-1}	$6.6 - 11.4 \times 10^{-2}$
LHC	14 TeV	3 ab^{-1}	$4 - 10 \times 10^{-2}$
ILC	250 GeV + 500 GeV	250 fb^{-1} 500 fb^{-1}	4.8-7.8 $\times 10^{-3}$
CLIC	350 GeV + 1.4 TeV + 3.0 TeV	500 fb^{-1} 1.5 ab^{-1} 2 ab^{-1}	2.2 $\times 10^{-3}$
TLEP	240 GeV + 350 GeV	10 ab^{-1} 2.6 ab^{-1}	2 $\times 10^{-3}$



- **complementarity:**
  - direct searches win at small couplings
  - indirect searches probe new territory at large coupling

Higgs & New Physics: Summary

(courtesy of A. Wulzer@ZPW2017)

Top Partner Searches:

- strongly connected with tuning
- however light Top Partners avoided in peculiar "Twin Higgs" models

Vector Searches:

- less directly related to tuning (but still, higher mass-reach ...)
- apply to broader class of comp. models (TC, TH, W-comp.)

Higgs Couplings:

- very model independent and very strong.
- part of a broad ("SM") exploration program
- slow progresses at run-2

Energy and Accuracy:

- W and Y as a **proof of concept**
- also a way to do **EWPT@LHC!!**
- looking for other channels with similar performances. **Diboson?**

3

BSM Higgs couplings: Baryogenesis

EW scale flavons for EW baryogenesis

Baldes, Konstandin, Servant '16

Electroweak baryogenesis requires:

- A strong first order phase transition
- Sufficient CP violation

However in the SM:

- The Higgs mass is too large
- Quark masses are too small

These negative results are tied to the fact that
Yukawa couplings during EW phase transition are identical the ones afterwards
What if they were larger?
E.g. flavor structure emerges during the EW transition

$$y_{ij} \bar{f}_L^i H f_R^j \quad \Rrightarrow \quad y_{ij} \left(\frac{\chi}{M}\right)^{q_H + q_j - q_i} \bar{f}_L^i H f_R^j$$

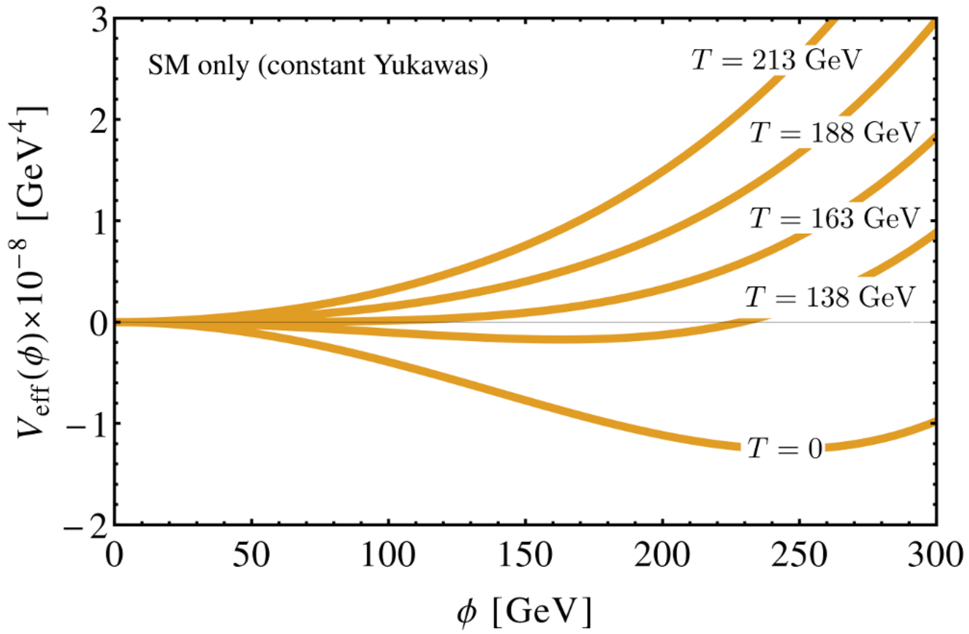
traditionally, M >> v and χ is frozen during EWSB

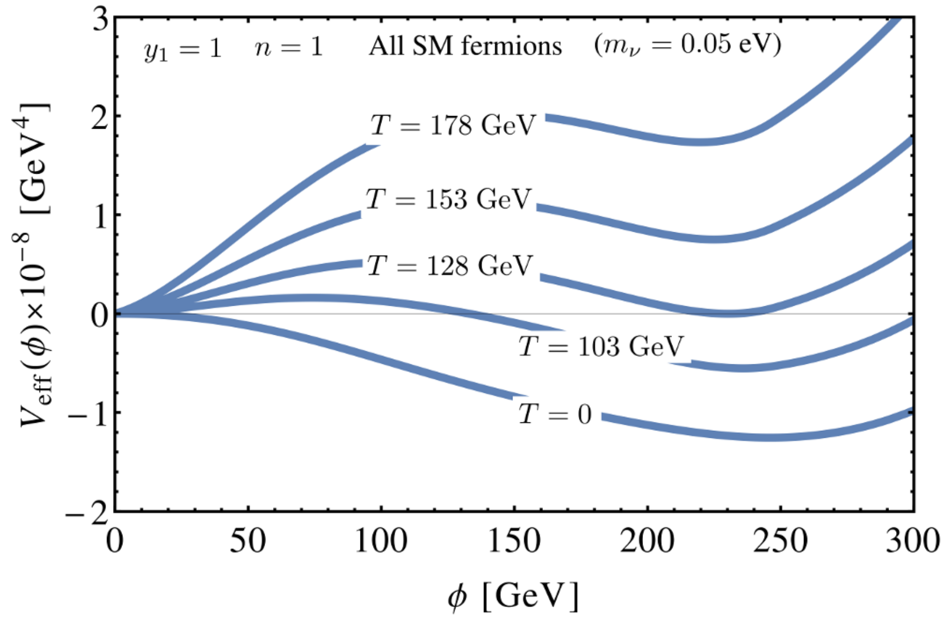
lowering M and allowing χ to vary leads to totally different phenomenology

EW scale flavons for EW baryogenesis

Baldes, Konstandin, Servant '16

$$y(\phi) = \begin{cases} y_1 \left(1 - \left[\frac{\phi}{v}\right]^n\right) + y_0 & \text{for} \quad \phi \le v, \\ y_0 & \text{for} \quad \phi \ge v. \end{cases}$$





The evolution of the effective potential with temperature in the SM (left) and with varying Yukawas (right) The varying Yukawa calculation includes all SM fermions with y1=1, n=1 and their respective y0, chosen to return the observed fermion masses today (the neutrinos are assumed to have a Dirac m=0.05eV).

In the varying Yukawa case, there is a first-order phase transition with ϕ_c=230GeV and Tc=128GeV (vs. second order transition at Tc=163GeV for the constant Yukawa case).

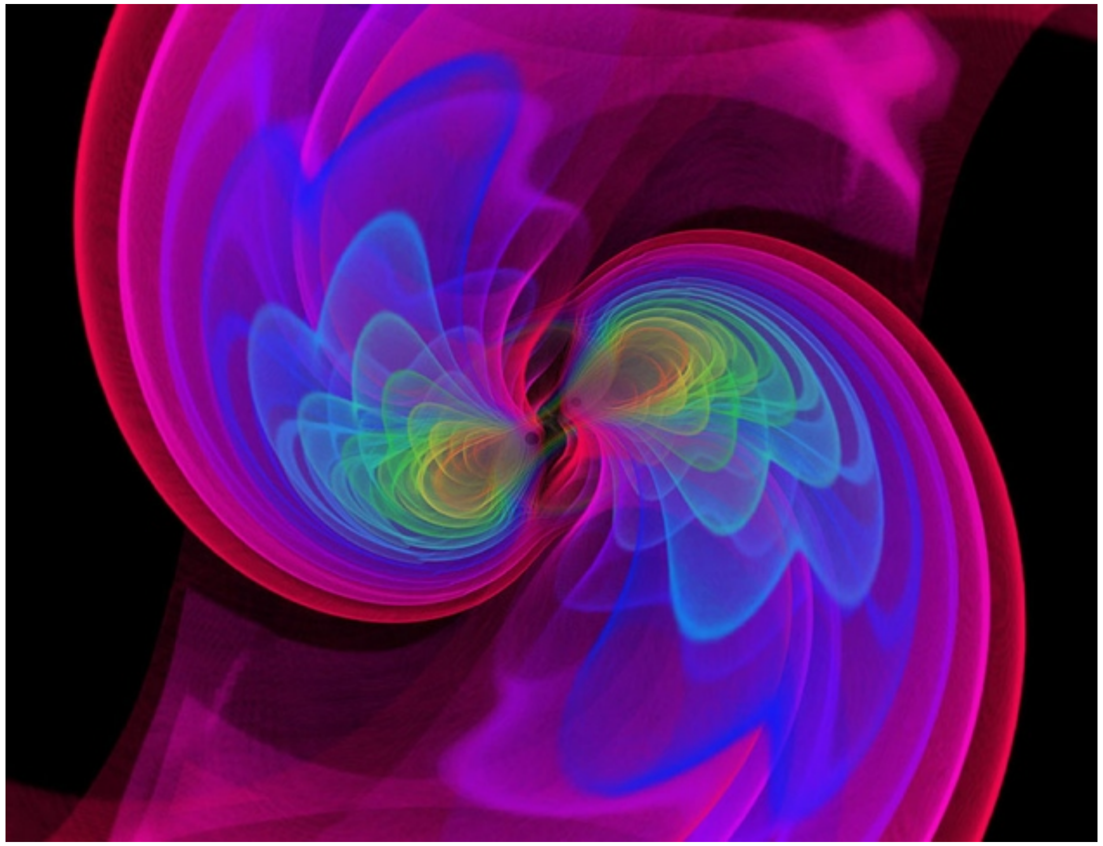
1st order phase transition + enhanced source of CP

4

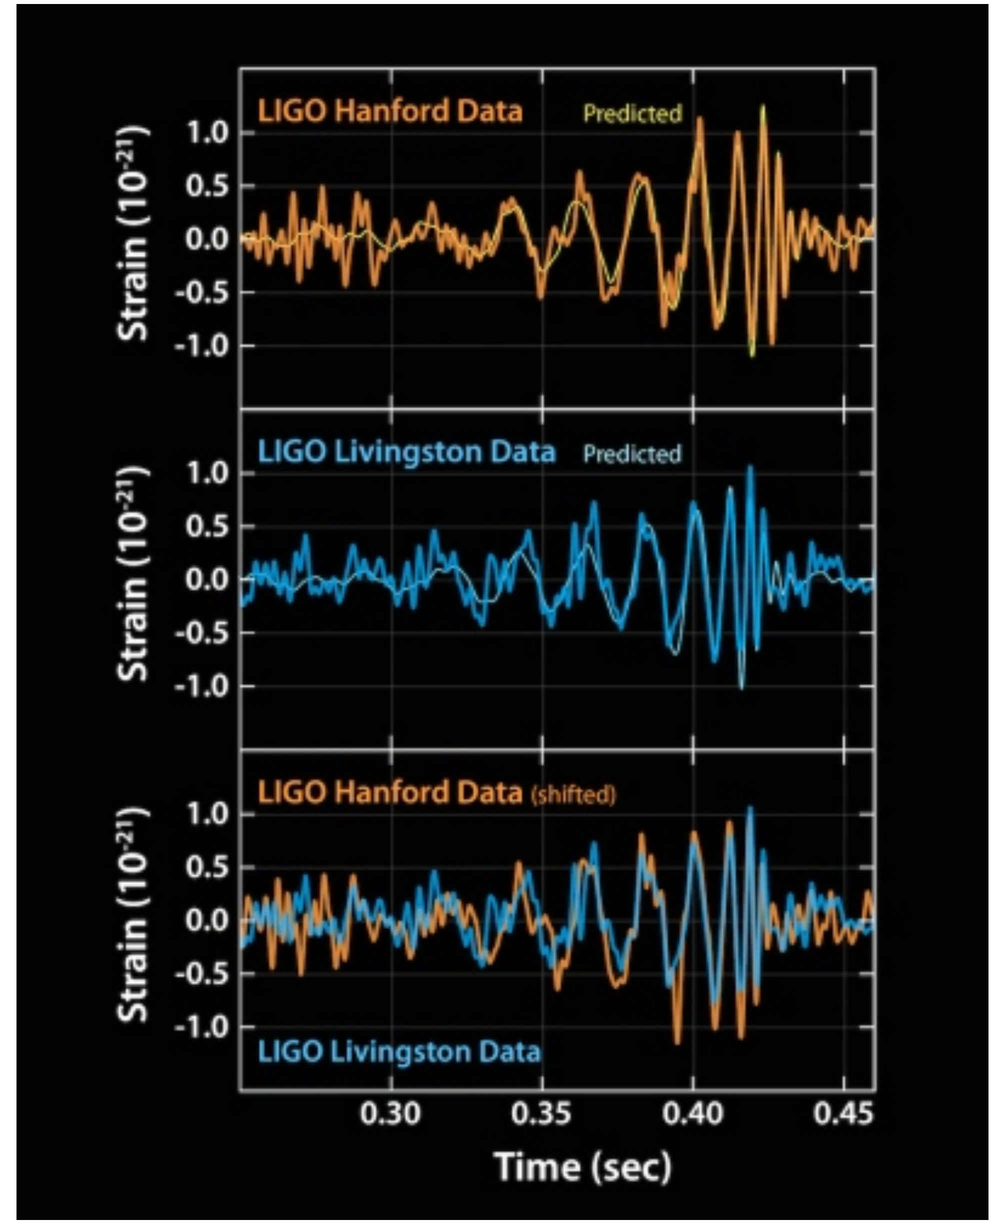
Fun with GW: stochastic GW background from phase transitions

The pictures of 2016

GW150914



1.3 billion years later on earth



what did it teach us?

- never give up against strong background when you know you are right
- $m_g < 10^{-22}$ eV ($c_g - c_\gamma < 10^{-17}$ GRB observed together with GW with the same origin?)
- no spectral distortions: scale of quantum gravity > 100 keV

GW and the ElectroWeak Phase Transition

GW interact very weakly and are not absorbed

direct probe of physical process of the very early universe

possible cosmological sources:

inflation, vibrations of topological defects, excitations of xdim modes, 1st order phase transitions...

ElectroWeak Phase Transition (if 1st order)

typical freq. ~ (size of the bubble)$^{-1}$ ~ (fraction of the horizon size)$^{-1}$

$$@\, T = 100 \text{ GeV}, \qquad H = \sqrt{\frac{8\pi^3}{45}\frac{T^2}{M_{Pl}}} \sim 10^{-15} \text{ GeV}$$

redshifted freq.

~ today ~

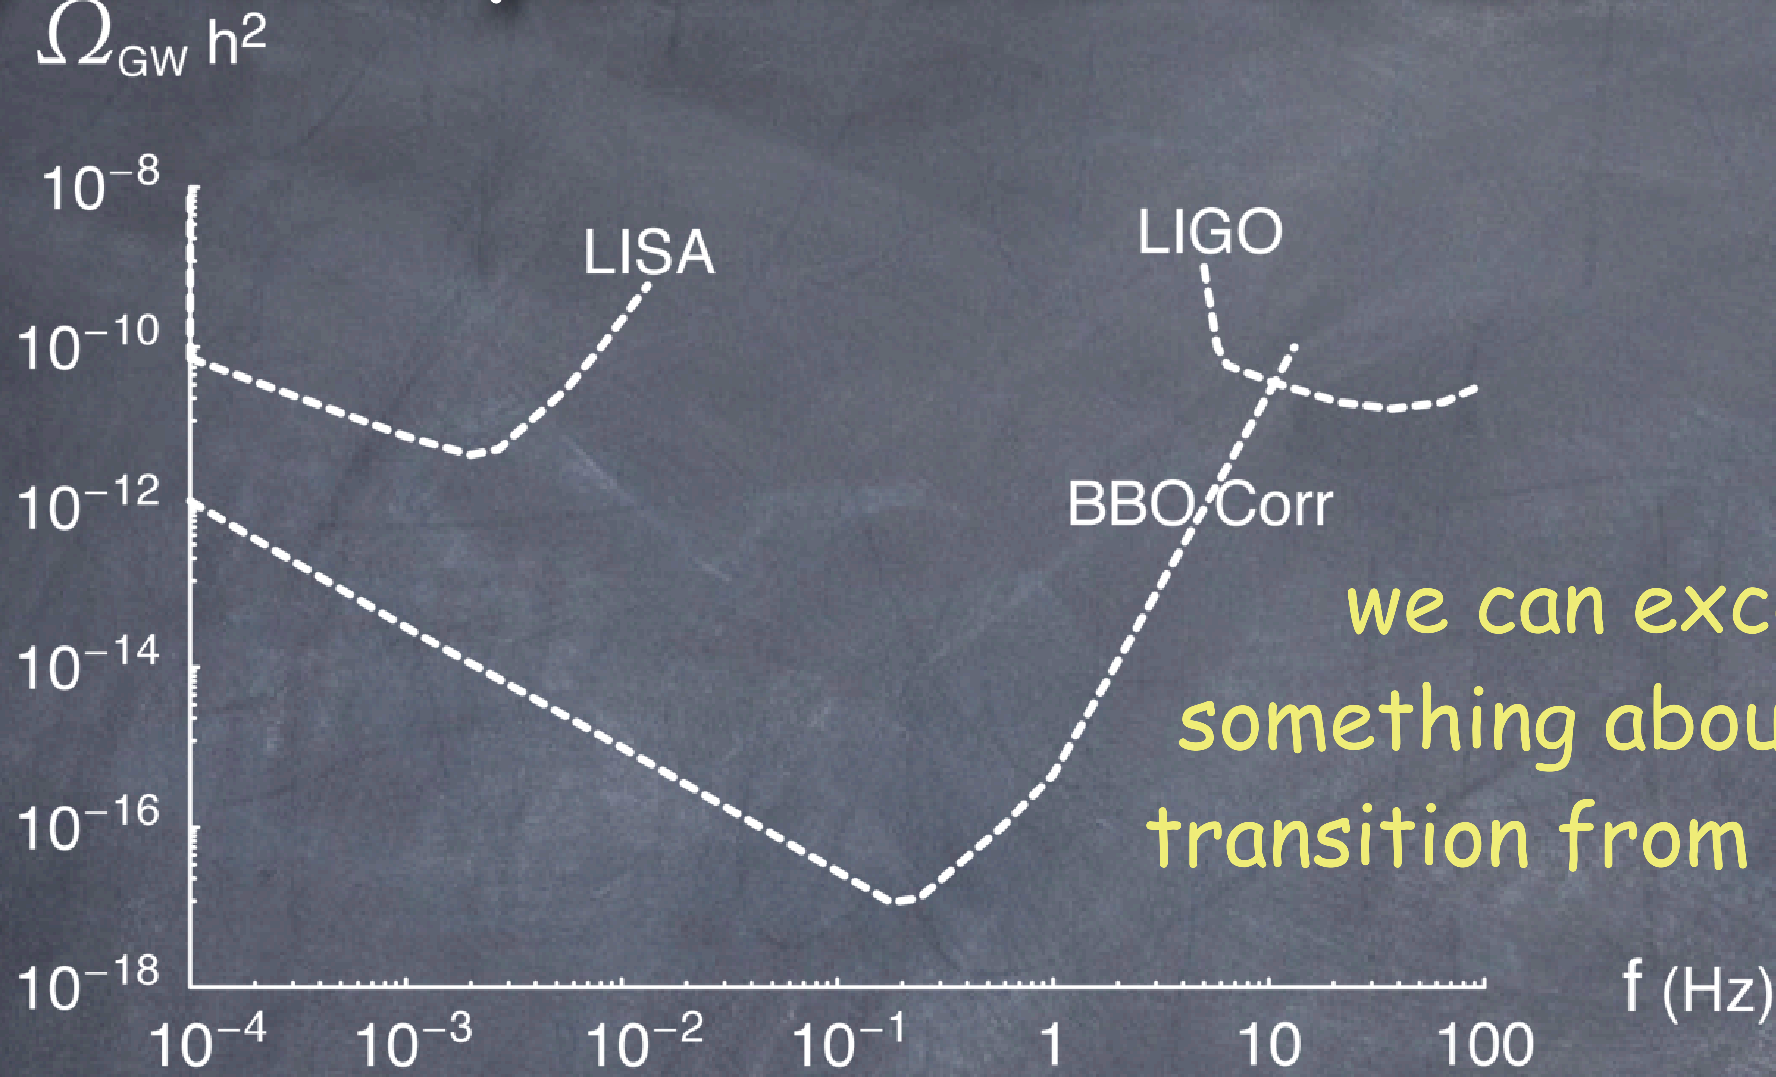
Grojean, Servant '06

The GW spectrum from a 1st order electroweak PT
is peaked around the milliHertz frequency

Why should you be excited about mHZ freq.?



Grojean, Servant '06

we can except to learn something about the EW phase transition from GW experiments

- test of the dynamics of the phase transition
  (quite important to analyze models of EW baryogenesis!)

redshift

$$\Omega^\star_{GW} \Rightarrow \Omega_{GW} = \left(\frac{a_\star}{a_0}\right)^4 \left(\frac{H_\star}{H_0}\right)^2 \Omega^\star_{GW} \sim 2{\cdot}10^{-5} h^{-2} \left(\frac{100}{g_\star}\right)^{1/3} \Omega^\star_{GW}$$

$$H_0 \sim h \times 2{\cdot}10^{-42}\,\mathrm{GeV}$$

Hunting for phase transitions with GW

P. Schwaller '15

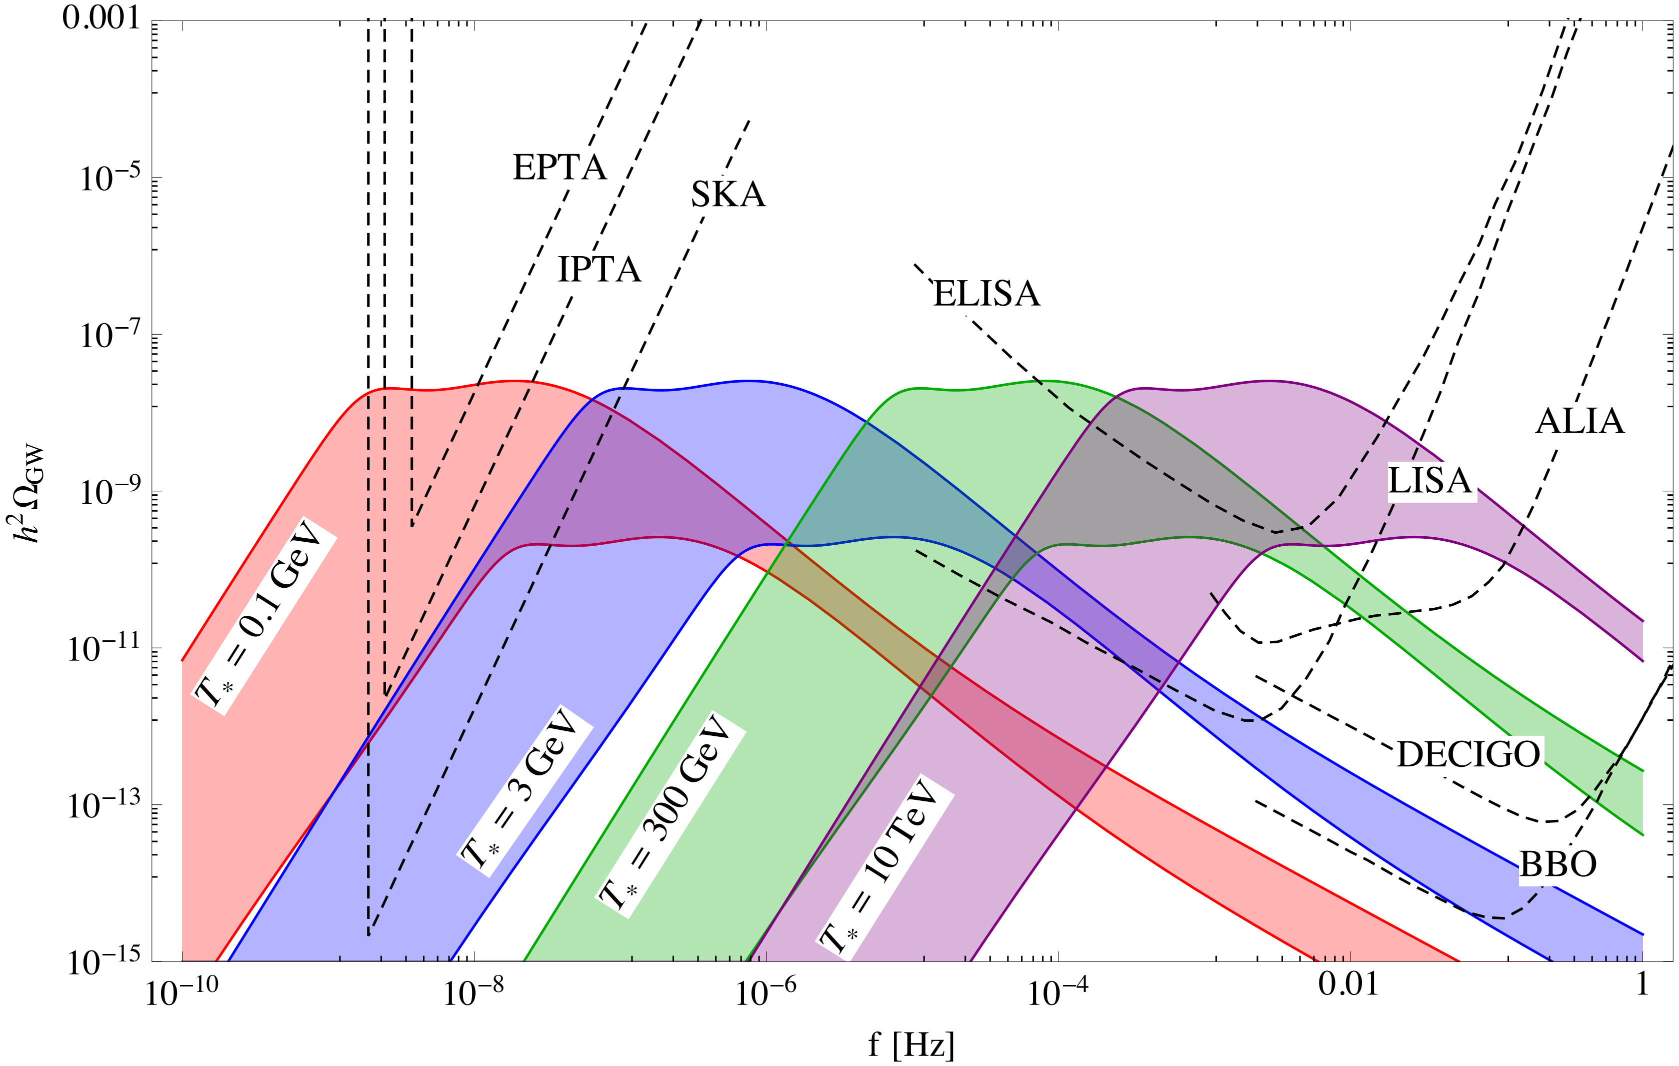


Figure 3: GW spectra $\Omega(f)h^2$ for $T_* = 0.1$ GeV (SIMP), $T_* = 3$ GeV (CDM1, TH models), $T_* = 300$ GeV and $T_* = 10$ TeV (CDM2 models). The upper (lower) edges of the contours correspond to $\beta = \mathcal{H}$ ($\beta = 10\mathcal{H}$), and furthermore $v = 1$ and $\Omega_{S*} = 0.1$ for all curves. The red band $T_* = 0.1$ GeV indicates where a signal of the QCD PT would lie if it was strong. The projected reach of several planned GW detection experiments is shown (dashed).

Naturalness without TeV-scale New Physics: relax!

Naturalness principle @ work

Following the arguments of Wilson, 't Hooft (and others):
only small numbers associated to **breaking of a symmetry** survive quantum corrections
(others are not necessarily theoretically inconsistent
but they require some conspiracy at different scales)

Beautiful examples of naturalness to understand the need of "new" physics

see for instance Giudice '13 (and refs. therein) for a recent account

- the need of the positron to screen the **electron** self-energy: $\Lambda < m_e/\alpha_{\rm em}$
- the rho meson to cutoff the EM contribution to the **charged pion** mass: $\Lambda^2 < \delta m_\pi^2/\alpha_{\rm em}$
- the **kaon mass** difference regulated by the charm quark: $\Lambda^2 < \dfrac{\delta m_K}{m_K} \dfrac{6\pi^2}{G_F^2 f_K^2 \sin^2\theta_C}$
- the **light Higgs** boson to screen the EW corrections to gauge bosons self-energies
- ...
- **new physics** at the weak scale to cancel the UV sensitivity of the Higgs mass**?**

The Darwinian solution to the Hierarchy

Other origin of small/large numbers according to Weyl and Dirac:
hierarchies are induced/created by time evolution/the age of the Universe

Can this idea be formulated in a QFT language?
In which sense is it addressing the stability of small numbers at the quantum level?

Graham, Kaplan, Rajendran '15

Espinosa et al '15

- Higgs mass-squared promoted to a field
- The field evolves in time in the early universe
  and scans a vast range of Higgs mass
- The Higgs mass-squared relaxes to a small negative value
- The electroweak symmetry breaking stops the time-evolution of the dynamical system

Self-organized criticality

dynamical evolution of a system is stopped at a critical point due to back-reaction

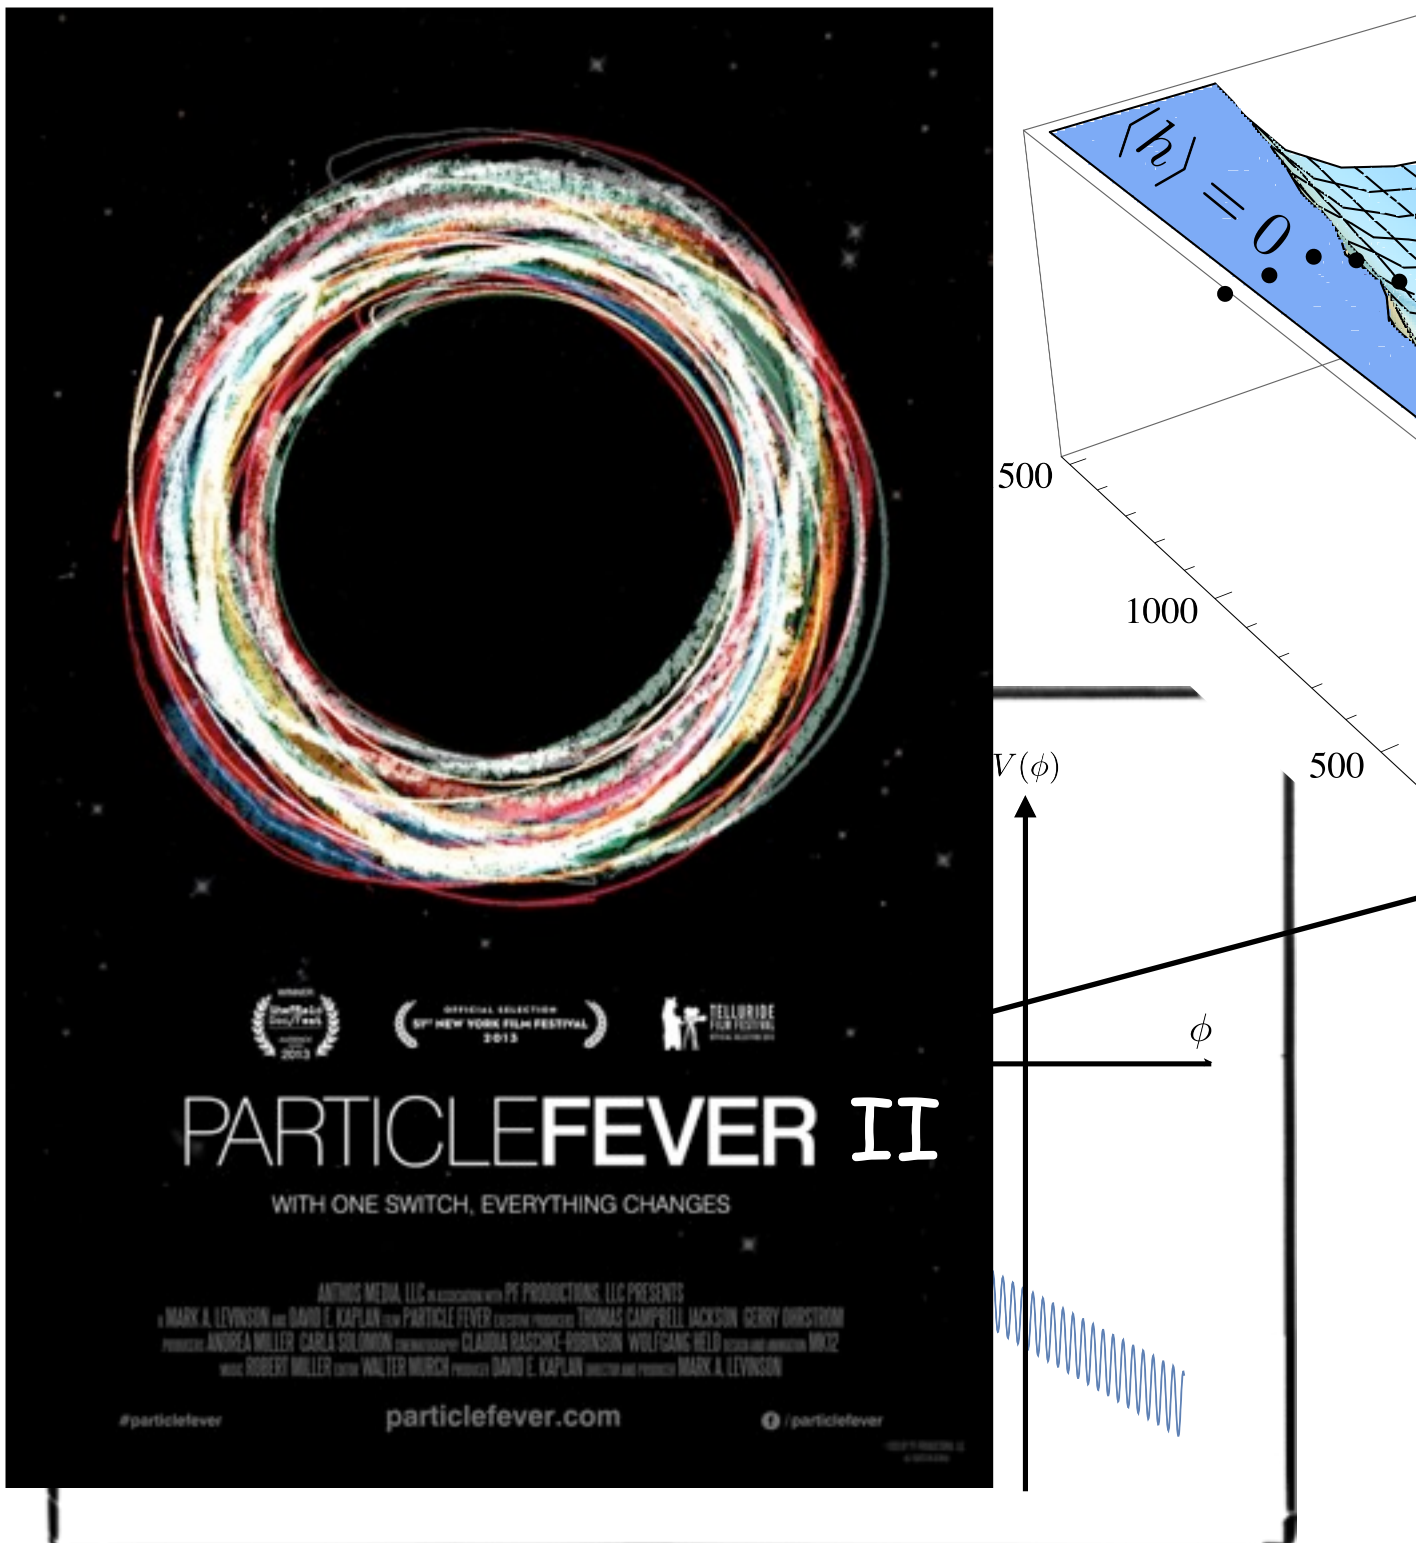
hierarchies result from **dynamics** not from **symmetries** anymore!

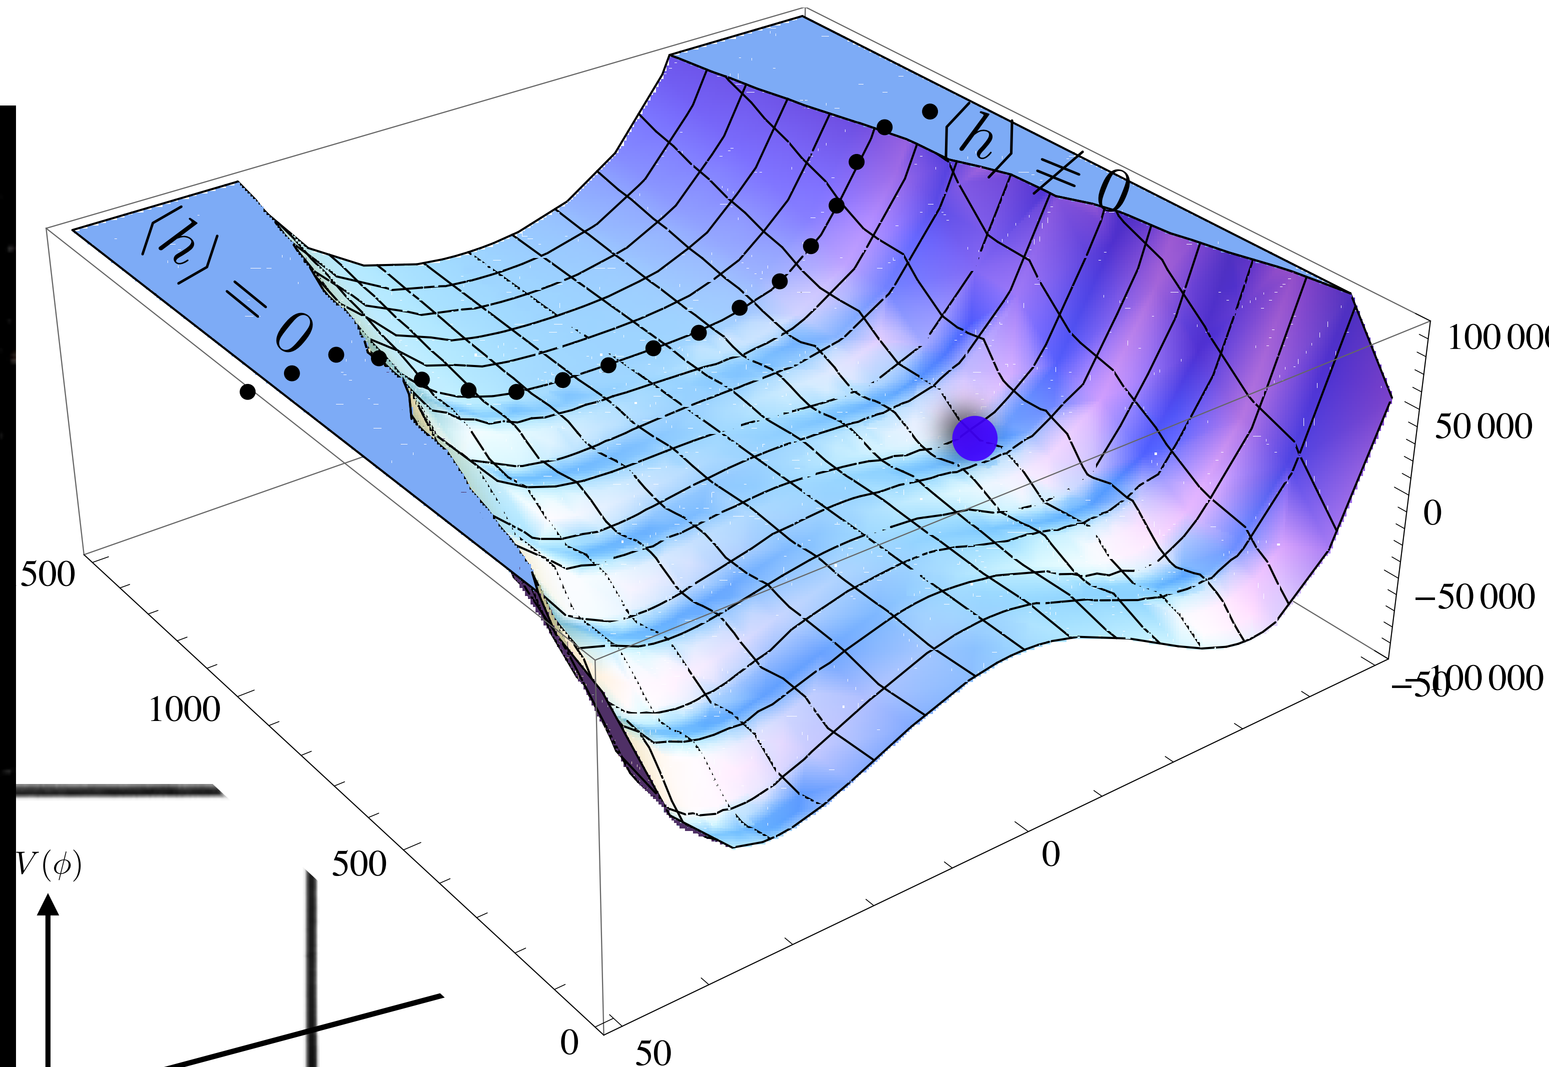
important consequences on the spectrum of new physics

Higgs-axion cosmological relaxation

Graham, Kaplan, Rajendran '15

ϕ



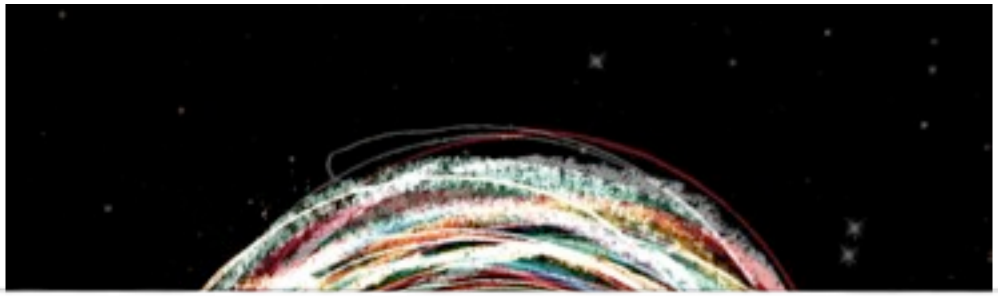


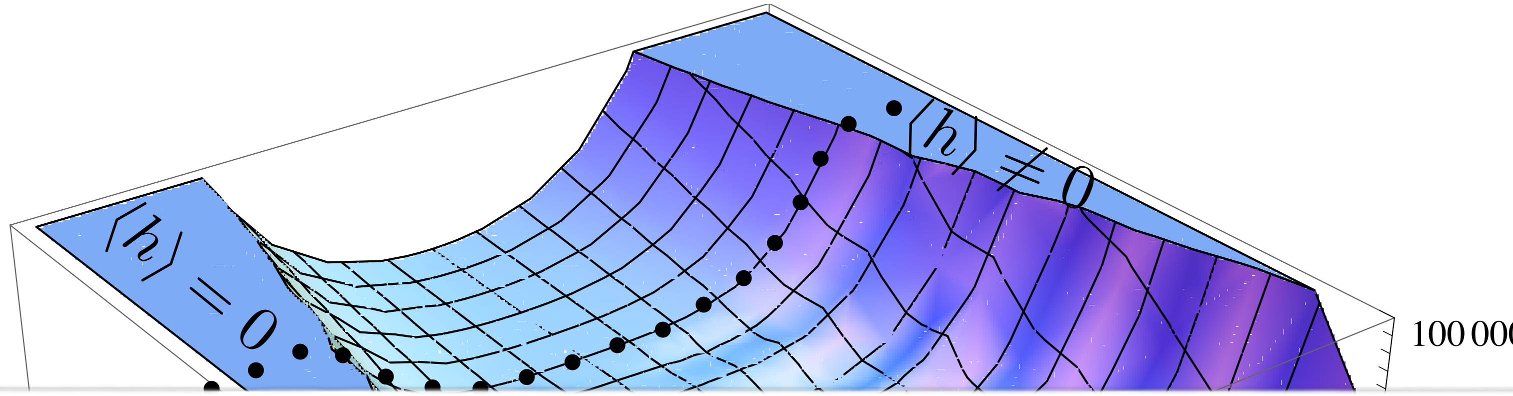
If ϕ continues rolling, the Higgs vev increases, the potential barrier increases and ultimately prevents ϕ from rolling down further

Higgs-axion cosmological relaxation

Graham, Kaplan, Rajendran '15

ϕ





Hierarchy problem solved
by light weakly coupled new physics
and not by TeV scale physics

~interesting atomic physics~

◎ change of atom sizes

Espinosa et al '15

~interesting cosmology signatures~

◎ BBN constraints

◎ decaying DM signs in γ-rays background

◎ ALPs

◎ superradiance

Choi and Im '16

~interesting signatures @ SHiP~

◎ production of light scalars
by B and K decays

Phenomenological signatures

Nothing to be discovered at the LHC/ILC/CLIC/CepC/SppC/FCC!

only BSM physics below Λ

two (very) light and very weakly coupled axion-like scalar fields

$$m_\phi \sim (10^{-20} - 10^{2})\,\mathrm{GeV}$$

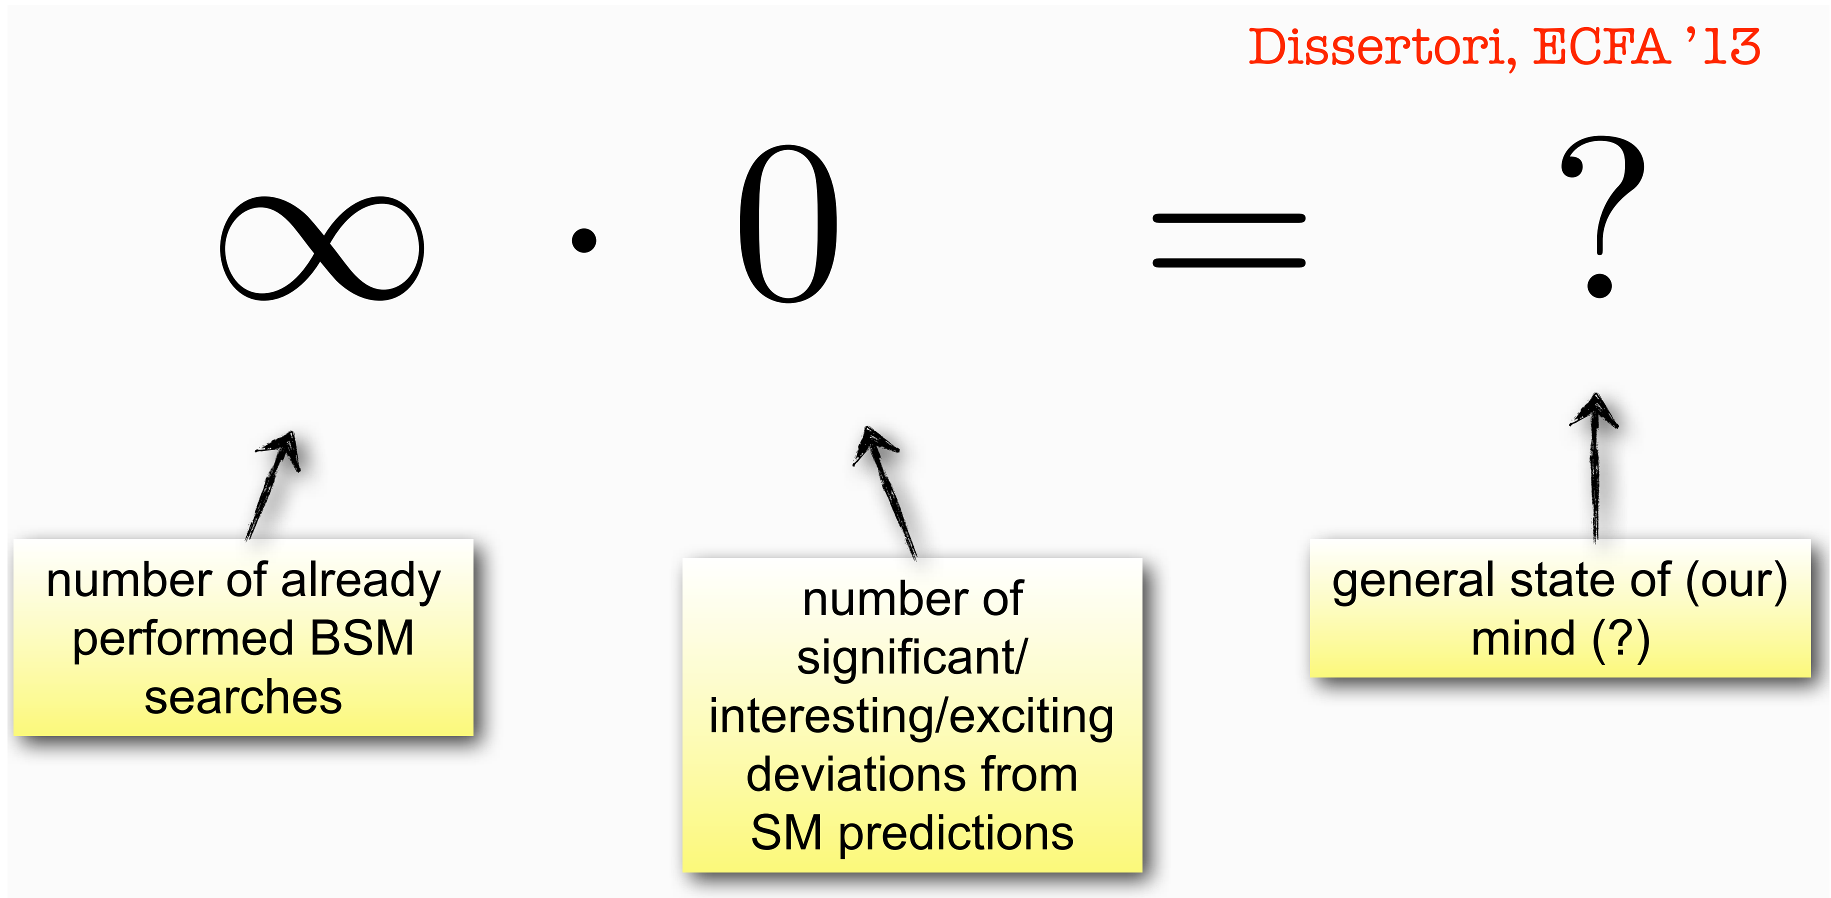
$$m_\sigma \sim (10^{-45} - 10^{-2})\,\mathrm{GeV}$$

interesting signatures in cosmology

Conclusions

Conclusions: Executive Summary

The LHC leaves us with the deepest mathematical pb:



Conclusions: Executive Summary

The LHC leaves us with the deepest mathematical pb:

Dissertori, ECFA '13

$$\infty \cdot 0 = ?$$

solitary Higgs boson with NO new physics at TeV scale
challenges our understanding of the quantum world
and forces a paradigm shift

The Higgs boson is the Santa Maria of the 21st century:
understanding the scalar sector of the SM
will help us grasping what lays beyond the SM

We also need the right **technological tools** (SHiP, ILC, CLIC, CepC, FCC...)
to continue exploring the unknown
